

Astronomers gather information about distant celestial objects from the electromagnetic radiation that these objects emit. In the project following Section 11.11 you are asked to compare the radiation emitted by different stars, including Betelgeuse (the largest of the observable stars), Sirius, and our own Sun.

## Sequences, Series, and Power Series

**IN ALL OF THE PREVIOUS CHAPTERS** we studied functions that are defined on an interval. In this chapter we start by studying sequences of numbers. A sequence can be viewed as a function whose domain is a set of natural numbers. We then consider infinite series (the sum of the numbers in a sequence). Isaac Newton represented functions defined on an interval as sums of infinite series, in part because such series are readily integrated and differentiated. In Section 11.10 we will see that his idea allows us to integrate functions that we have previously been unable to find antiderivatives for, such as  $e^{-x^2}$ . Many of the functions that arise in mathematical physics and chemistry—such as Bessel functions—are defined as sums of series, so it is important to be familiar with the basic concepts of convergence of infinite sequences and series.

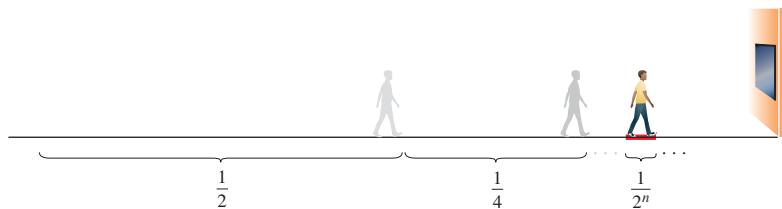

Physicists also use series in another way, as we will see in Section 11.11. In studying fields as diverse as optics, special relativity, electromagnetism, and cosmology, they analyze phenomena by replacing a function with the first few terms in the series that represents that function.

## 11.1 Sequences

Many concepts in calculus involve lists of numbers that result from applying a process in stages. For example, if we use Newton's method (Section 4.8) to approximate the zero of a function, we generate a list or *sequence* of numbers. If we compute average rates of change of a function over smaller and smaller intervals in order to approximate an instantaneous rate of change (as in Section 2.7), we also generate a sequence of numbers.

In the fifth century BC the Greek philosopher Zeno of Elea posed four problems, now known as *Zeno's paradoxes*, that were intended to challenge some of the ideas concerning space and time that were held in his day. In one of his paradoxes, Zeno argued that a man standing in a room could never walk to a wall because he would first have to walk half the distance to the wall, then half the remaining distance, and then again half of what still remains, continuing in this way indefinitely (see Figure 1). The distances that the man walks at each stage form a sequence:

$$\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \dots, \frac{1}{2^n}, \dots$$

**FIGURE 1**

At the  $n$ th stage the man walks a distance  $1/2^n$ .

### ■ Infinite Sequences

An **infinite sequence**, or just a **sequence**, can be thought of as a list of numbers written in a definite order:

$$a_1, a_2, a_3, a_4, \dots, a_n, \dots$$

The number  $a_1$  is called the *first term*,  $a_2$  is the *second term*, and in general  $a_n$  is the  *$n$ th term*. We will deal exclusively with infinite sequences and so each term  $a_n$  will have a successor  $a_{n+1}$ .

Notice that for every positive integer  $n$  there is a corresponding number  $a_n$  and so a sequence can be defined as a function  $f$  whose domain is the set of positive integers. But we usually write  $a_n$  instead of the function notation  $f(n)$  for the value of the function at the number  $n$ .

**NOTATION** The sequence  $\{a_1, a_2, a_3, \dots\}$  is also denoted by

$$\{a_n\} \quad \text{or} \quad \{a_n\}_{n=1}^{\infty}$$

Unless otherwise stated, we assume that  $n$  starts at 1.

**EXAMPLE 1** Some sequences can be defined by giving a formula for the  $n$ th term.

- (a) At the beginning of the section we described a sequence of distances walked by a man in a room. The following are three equivalent descriptions of this sequence:

$$\left\{ \frac{1}{2^n} \right\} \quad a_n = \frac{1}{2^n} \quad \left\{ \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \dots, \frac{1}{2^n}, \dots \right\}$$

In the third description we have written out the first few terms of the sequence:  
 $a_1 = 1/2^1$ ,  $a_2 = 1/2^2$ , and so on.

- (b) The definition  $\left\{ \frac{n}{n+1} \right\}_{n=2}^{\infty}$  indicates that the formula for the  $n$ th term is  $a_n = \frac{n}{n+1}$  and we start the sequence with  $n = 2$ :

$$\left\{ \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \dots \right\}$$

- (c) The sequence  $\{\sqrt{3}, \sqrt{4}, \sqrt{5}, \sqrt{6}, \dots\}$  can be described by  $\{\sqrt{n+2}\}_{n=1}^{\infty}$  if we start with  $n = 1$ . Equivalently, we could start with  $n = 3$  and write  $\{\sqrt{n}\}_{n=3}^{\infty}$  or  $a_n = \sqrt{n}$ ,  $n \geq 3$ .

- (d) The definition  $\left\{ (-1)^n \frac{(n+1)}{3^n} \right\}_{n=0}^{\infty}$  generates the sequence

$$\left\{ \frac{1}{1}, -\frac{2}{3}, \frac{3}{9}, -\frac{4}{27}, \frac{5}{81}, \dots \right\}$$

Here the first term corresponds to  $n = 0$  and the  $(-1)^n$  factor in the definition creates terms that alternate between positive and negative. ■

**EXAMPLE 2** Find a formula for the general term  $a_n$  of the sequence

$$\left\{ \frac{3}{5}, -\frac{4}{25}, \frac{5}{125}, -\frac{6}{625}, \frac{7}{3125}, \dots \right\}$$

assuming that the pattern of the first few terms continues.

**SOLUTION** We are given that

$$a_1 = \frac{3}{5} \quad a_2 = -\frac{4}{25} \quad a_3 = \frac{5}{125} \quad a_4 = -\frac{6}{625} \quad a_5 = \frac{7}{3125}$$

Notice that the numerators of these fractions start with 3 and increase by 1 whenever we go to the next term. The second term has numerator 4, the third term has numerator 5; in general, the  $n$ th term will have numerator  $n+2$ . The denominators are the powers of 5, so  $a_n$  has denominator  $5^n$ . The signs of the terms are alternately positive and negative, so we need to multiply by a power of  $-1$ , as in Example 1(d). Here we want  $a_1$  to be positive and so we use  $(-1)^{n-1}$  or  $(-1)^{n+1}$ . Therefore

$$a_n = (-1)^{n-1} \frac{n+2}{5^n}$$

**EXAMPLE 3** Here are some sequences that don't have a simple defining equation.

- (a) The sequence  $\{p_n\}$ , where  $p_n$  is the population of the world as of January 1 in the year  $n$ .
- (b) If we let  $a_n$  be the digit in the  $n$ th decimal place of the number  $e$ , then  $\{a_n\}$  is a sequence whose first few terms are

$$\{7, 1, 8, 2, 8, 1, 8, 2, 8, 4, 5, \dots\}$$

- (c) **The Fibonacci sequence**  $\{f_n\}$  is defined *recursively* by the conditions

$$f_1 = 1 \quad f_2 = 1 \quad f_n = f_{n-1} + f_{n-2} \quad n \geq 3$$

Each term is the sum of the two preceding terms. The first few terms are

$$\{1, 1, 2, 3, 5, 8, 13, 21, \dots\}$$

This sequence arose when the 13th-century Italian mathematician known as Fibonacci solved a problem concerning the breeding of rabbits (see Exercise 89). ■

### The Limit of a Sequence

A sequence can be pictured either by plotting its terms on a number line or by plotting its graph. Figures 2 and 3 illustrate these representations for the sequence

$$\left\{ \frac{n}{n+1} \right\} = \left\{ \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots \right\}$$

Since a sequence  $\{a_n\}_{n=1}^{\infty}$  is a function whose domain is the set of positive integers, its graph consists of discrete points with coordinates

$$(1, a_1) \quad (2, a_2) \quad (3, a_3) \quad \dots \quad (n, a_n) \quad \dots$$

From Figure 2 or Figure 3 it appears that the terms of the sequence  $a_n = n/(n + 1)$  are approaching 1 as  $n$  becomes large. In fact, the difference

$$1 - \frac{n}{n+1} = \frac{1}{n+1}$$

can be made as small as we like by taking  $n$  sufficiently large. We indicate this by writing

$$\lim_{n \rightarrow \infty} \frac{n}{n+1} = 1$$

In general, the notation

$$\lim_{n \rightarrow \infty} a_n = L$$

means that the terms of the sequence  $\{a_n\}$  approach  $L$  as  $n$  becomes large. Notice that the following definition of the limit of a sequence is very similar to the definition of a limit of a function at infinity given in Section 2.6.

**1 Intuitive Definition of a Limit of a Sequence** A sequence  $\{a_n\}$  has the **limit  $L$**  and we write

$$\lim_{n \rightarrow \infty} a_n = L \quad \text{or} \quad a_n \rightarrow L \text{ as } n \rightarrow \infty$$

if we can make the terms  $a_n$  as close to  $L$  as we like by taking  $n$  sufficiently large. If  $\lim_{n \rightarrow \infty} a_n$  exists, we say the sequence **converges** (or is **convergent**). Otherwise, we say the sequence **diverges** (or is **divergent**).

Figure 4 illustrates Definition 1 by showing the graphs of two convergent sequences that have the limit  $L$ .

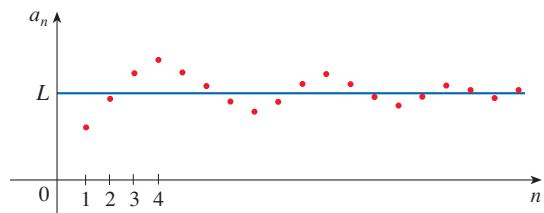

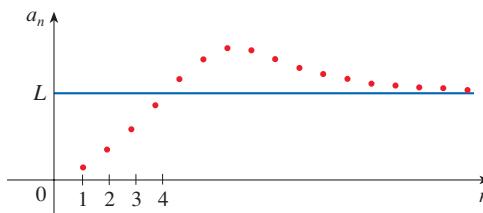

FIGURE 2

Graphs of two convergent sequences with  $\lim_{n \rightarrow \infty} a_n = L$

A more precise version of Definition 1 is as follows.

**2 Precise Definition of a Limit of a Sequence** A sequence  $\{a_n\}$  has the limit  $L$  and we write

$$\lim_{n \rightarrow \infty} a_n = L \quad \text{or} \quad a_n \rightarrow L \text{ as } n \rightarrow \infty$$

if for every  $\varepsilon > 0$  there is a corresponding integer  $N$  such that

$$\text{if } n > N \quad \text{then} \quad |a_n - L| < \varepsilon$$

Compare this definition with Definition 2.6.7.

Definition 2 is illustrated by Figure 5, in which the terms  $a_1, a_2, a_3, \dots$  are plotted on a number line. No matter how small an interval  $(L - \varepsilon, L + \varepsilon)$  is chosen, there exists an  $N$  such that all terms of the sequence from  $a_{N+1}$  onward must lie in that interval.

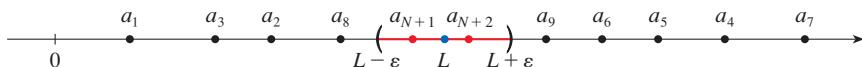

FIGURE 5

Another illustration of Definition 2 is given in Figure 6. The points on the graph of  $\{a_n\}$  must lie between the horizontal lines  $y = L + \varepsilon$  and  $y = L - \varepsilon$  if  $n > N$ . This picture must be valid no matter how small  $\varepsilon$  is chosen, but usually a smaller  $\varepsilon$  requires a larger  $N$ .

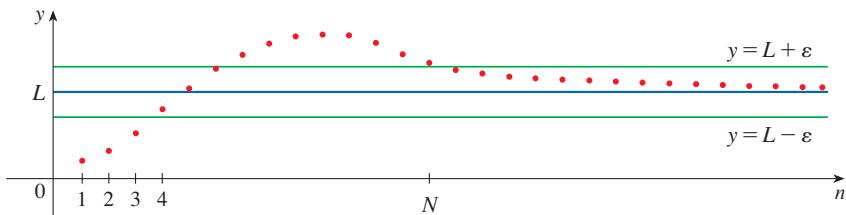

FIGURE 6

A sequence *diverges* if its terms do not approach a single number. Figure 7 illustrates two different ways in which a sequence can diverge.

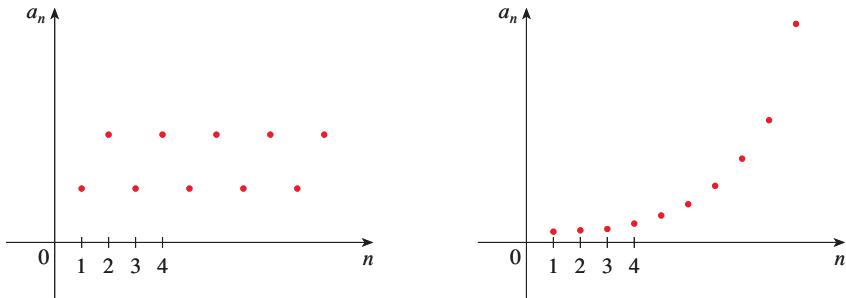

FIGURE 7

Graphs of two divergent sequences

The sequence graphed in Figure 7(a) diverges because it oscillates between two different numbers and does not approach a single value as  $n \rightarrow \infty$ . In the graph in part (b),  $a_n$  increases without bound as  $n$  becomes larger. We write  $\lim_{n \rightarrow \infty} a_n = \infty$  to indicate the

particular way that this sequence diverges, and we say that the sequence diverges to  $\infty$ . The following precise definition is similar to Definition 2.6.9.

**3 Precise Definition of an Infinite Limit** The notation  $\lim_{n \rightarrow \infty} a_n = \infty$  means that for every positive number  $M$  there is an integer  $N$  such that

$$\text{if } n > N \quad \text{then } a_n > M$$

An analogous definition applies for  $\lim_{n \rightarrow \infty} a_n = -\infty$ .

### Properties of Convergent Sequences

If you compare Definition 2 with Definition 2.6.7, you will see that the only difference between  $\lim_{n \rightarrow \infty} a_n = L$  and  $\lim_{x \rightarrow \infty} f(x) = L$  is that  $n$  is required to be an integer. Thus we have the following theorem, which is illustrated by Figure 8.

**4 Theorem** If  $\lim_{x \rightarrow \infty} f(x) = L$  and  $f(n) = a_n$  when  $n$  is an integer, then  $\lim_{n \rightarrow \infty} a_n = L$ .

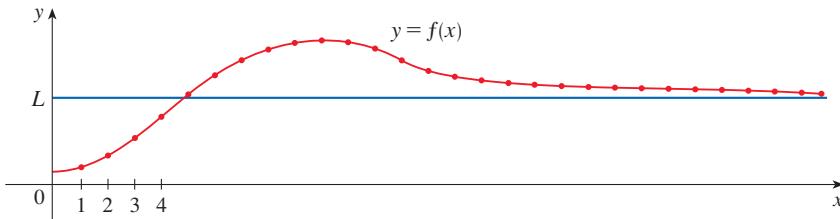

FIGURE 8

For instance, since we know that  $\lim_{x \rightarrow \infty} (1/x^r) = 0$  when  $r > 0$  (Theorem 2.6.5), it follows from Theorem 4 that

$$\boxed{5} \quad \lim_{n \rightarrow \infty} \frac{1}{n^r} = 0 \quad \text{if } r > 0$$

The Limit Laws given in Section 2.3 also hold for the limits of sequences and their proofs are similar.

**Limit Laws for Sequences** Suppose that  $\{a_n\}$  and  $\{b_n\}$  are convergent sequences and  $c$  is a constant. Then

**Sum Law**

$$1. \quad \lim_{n \rightarrow \infty} (a_n + b_n) = \lim_{n \rightarrow \infty} a_n + \lim_{n \rightarrow \infty} b_n$$

**Difference Law**

$$2. \quad \lim_{n \rightarrow \infty} (a_n - b_n) = \lim_{n \rightarrow \infty} a_n - \lim_{n \rightarrow \infty} b_n$$

**Constant Multiple Law**

$$3. \quad \lim_{n \rightarrow \infty} ca_n = c \lim_{n \rightarrow \infty} a_n$$

**Product Law**

$$4. \quad \lim_{n \rightarrow \infty} (a_n b_n) = \lim_{n \rightarrow \infty} a_n \cdot \lim_{n \rightarrow \infty} b_n$$

**Quotient Law**

$$5. \quad \lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \frac{\lim_{n \rightarrow \infty} a_n}{\lim_{n \rightarrow \infty} b_n} \quad \text{if } \lim_{n \rightarrow \infty} b_n \neq 0$$

Another useful property of sequences is the following Power Law, which you are asked to prove in Exercise 94.

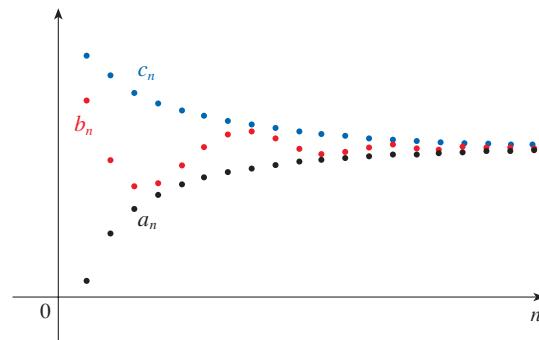

**Power Law**

$$\lim_{n \rightarrow \infty} a_n^p = \left[ \lim_{n \rightarrow \infty} a_n \right]^p \quad \text{if } p > 0 \text{ and } a_n > 0$$

The Squeeze Theorem can also be adapted for sequences as follows (see Figure 9).

**Squeeze Theorem for Sequences**

If  $a_n \leq b_n \leq c_n$  for  $n \geq n_0$  and  $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} c_n = L$ , then  $\lim_{n \rightarrow \infty} b_n = L$ .

**FIGURE 9**

The sequence  $\{b_n\}$  is squeezed between the sequences  $\{a_n\}$  and  $\{c_n\}$ .

Another useful fact about limits of sequences is given by the following theorem; the proof is left as Exercise 93.

**6 Theorem**

If  $\lim_{n \rightarrow \infty} |a_n| = 0$ , then  $\lim_{n \rightarrow \infty} a_n = 0$ .

**EXAMPLE 4** Find  $\lim_{n \rightarrow \infty} \frac{n}{n + 1}$ .

**SOLUTION** The method is similar to the one we used in Section 2.6: divide numerator and denominator by the highest power of  $n$  that occurs in the denominator and then use the Limit Laws for Sequences.

In general, for any constant  $c$

$$\lim_{n \rightarrow \infty} c = c$$

This shows that the guess we made earlier from Figures 2 and 3 was correct.

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{n}{n + 1} &= \lim_{n \rightarrow \infty} \frac{1}{1 + \frac{1}{n}} = \frac{\lim_{n \rightarrow \infty} 1}{\lim_{n \rightarrow \infty} 1 + \lim_{n \rightarrow \infty} \frac{1}{n}} \\ &= \frac{1}{1 + 0} = 1 \end{aligned}$$

Here we used Equation 5 with  $r = 1$ . ■

**EXAMPLE 5** Is the sequence  $a_n = \frac{n}{\sqrt{10 + n}}$  convergent or divergent?

**SOLUTION** As in Example 4, we divide numerator and denominator by  $n$ :

$$\lim_{n \rightarrow \infty} \frac{n}{\sqrt{10+n}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{\frac{10}{n^2} + \frac{1}{n}}} = \infty$$

since the numerator is constant and the denominator (which is positive) approaches 0. So  $\{a_n\}$  is divergent. ■

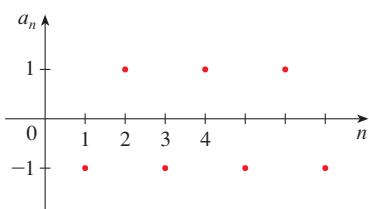

**EXAMPLE 6** Calculate  $\lim_{n \rightarrow \infty} \frac{\ln n}{n}$ .

**SOLUTION** Notice that both numerator and denominator approach infinity as  $n \rightarrow \infty$ . We can't apply l'Hospital's Rule directly because it applies not to sequences but to functions of a real variable. However, we can apply l'Hospital's Rule to the related function  $f(x) = (\ln x)/x$  and obtain

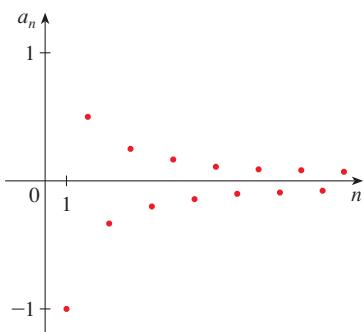

$$\lim_{x \rightarrow \infty} \frac{\ln x}{x} = \lim_{x \rightarrow \infty} \frac{1/x}{1} = 0$$

Therefore, by Theorem 4, we have

$$\lim_{n \rightarrow \infty} \frac{\ln n}{n} = 0$$

**FIGURE 10** The sequence  $\{(-1)^n\}$

**FIGURE 11** The sequence  $\left\{ \frac{(-1)^n}{n} \right\}$

**EXAMPLE 7** Determine whether the sequence  $a_n = (-1)^n$  is convergent or divergent.

**SOLUTION** If we write out the terms of the sequence, we obtain

$$\{-1, 1, -1, 1, -1, 1, -1, \dots\}$$

The graph of this sequence is shown in Figure 10. Since the terms oscillate between 1 and  $-1$  infinitely often,  $a_n$  does not approach any number. Thus  $\lim_{n \rightarrow \infty} (-1)^n$  does not exist; that is, the sequence  $\{(-1)^n\}$  is divergent. ■

**EXAMPLE 8** Evaluate  $\lim_{n \rightarrow \infty} \frac{(-1)^n}{n}$  if it exists.

**SOLUTION** We first calculate the limit of the absolute value:

$$\lim_{n \rightarrow \infty} \left| \frac{(-1)^n}{n} \right| = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

Therefore, by Theorem 6,

$$\lim_{n \rightarrow \infty} \frac{(-1)^n}{n} = 0$$

The sequence is graphed in Figure 11. ■

The following theorem says that if we apply a continuous function to the terms of a convergent sequence, the result is also convergent. The proof is given in Appendix F.

7

**Theorem** If  $\lim_{n \rightarrow \infty} a_n = L$  and the function  $f$  is continuous at  $L$ , then

$$\lim_{n \rightarrow \infty} f(a_n) = f(L)$$

**EXAMPLE 9** Find  $\lim_{n \rightarrow \infty} \sin \frac{\pi}{n}$ .

**SOLUTION** Because the sine function is continuous at 0, Theorem 7 enables us to write

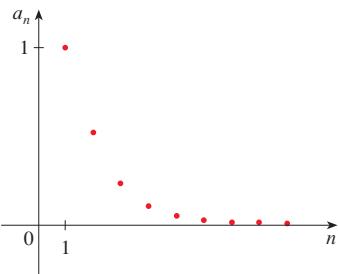

$$\lim_{n \rightarrow \infty} \sin \frac{\pi}{n} = \sin \left( \lim_{n \rightarrow \infty} \frac{\pi}{n} \right) = \sin 0 = 0 \quad \blacksquare$$

**EXAMPLE 10** Discuss the convergence of the sequence  $a_n = n!/n^n$ , where  $n! = 1 \cdot 2 \cdot 3 \cdots \cdot n$ .

**SOLUTION** Both numerator and denominator approach infinity as  $n \rightarrow \infty$  but here we have no corresponding function for use with l'Hospital's Rule ( $x!$  is not defined when  $x$  is not an integer). Let's write out a few terms to get a feeling for what happens to  $a_n$  as  $n$  gets large:

$$a_1 = 1 \qquad a_2 = \frac{1 \cdot 2}{2 \cdot 2} \qquad a_3 = \frac{1 \cdot 2 \cdot 3}{3 \cdot 3 \cdot 3}$$

8 
$$a_n = \frac{1 \cdot 2 \cdot 3 \cdots \cdot n}{n \cdot n \cdot n \cdots \cdot n}$$

**FIGURE 12** The sequence  $\{n!/n^n\}$

It appears from these expressions and the graph in Figure 12 that the terms are decreasing and perhaps approach 0. To confirm this, observe from Equation 8 that

$$a_n = \frac{1}{n} \left( \frac{2 \cdot 3 \cdots \cdot n}{n \cdot n \cdots \cdot n} \right)$$

Notice that the expression in parentheses is at most 1 because the numerator is less than (or equal to) the denominator. So

$$0 < a_n \leq \frac{1}{n}$$

We know that  $1/n \rightarrow 0$  as  $n \rightarrow \infty$ . Therefore  $a_n \rightarrow 0$  as  $n \rightarrow \infty$  by the Squeeze Theorem. ■

**EXAMPLE 11** For what values of  $r$  is the sequence  $\{r^n\}$  convergent?

**SOLUTION** We know from Section 2.6 and the graphs of the exponential functions in Section 1.4 that  $\lim_{x \rightarrow \infty} b^x = \infty$  for  $b > 1$  and  $\lim_{x \rightarrow \infty} b^x = 0$  for  $0 < b < 1$ . Therefore, putting  $b = r$  and using Theorem 4, we have

$$\lim_{n \rightarrow \infty} r^n = \begin{cases} \infty & \text{if } r > 1 \\ 0 & \text{if } 0 < r < 1 \end{cases}$$

It is obvious that

$$\lim_{n \rightarrow \infty} 1^n = 1 \quad \text{and} \quad \lim_{n \rightarrow \infty} 0^n = 0$$

If  $-1 < r < 0$ , then  $0 < |r| < 1$ , so

$$\lim_{n \rightarrow \infty} |r^n| = \lim_{n \rightarrow \infty} |r|^n = 0$$

and therefore  $\lim_{n \rightarrow \infty} r^n = 0$  by Theorem 6. If  $r \leq -1$ , then  $\{r^n\}$  diverges as in Example 7. Figure 13 shows the graphs for various values of  $r$ . (The case  $r = -1$  is shown in Figure 10.)

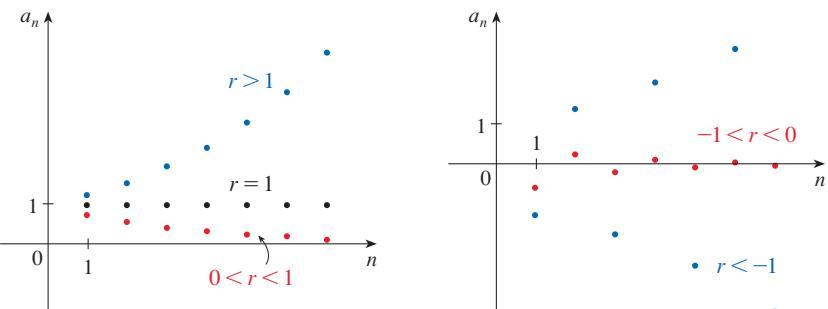

FIGURE 13

The sequence  $a_n = r^n$ 

The results of Example 11 are summarized for future use as follows.

**9** The sequence  $\{r^n\}$  is convergent if  $-1 < r \leq 1$  and divergent for all other values of  $r$ .

$$\lim_{n \rightarrow \infty} r^n = \begin{cases} 0 & \text{if } -1 < r < 1 \\ 1 & \text{if } r = 1 \end{cases}$$

### ■ Monotonic and Bounded Sequences

Sequences for which the terms always increase (or always decrease) play a special role in the study of sequences.

**10 Definition** A sequence  $\{a_n\}$  is called **increasing** if  $a_n < a_{n+1}$  for all  $n \geq 1$ , that is,  $a_1 < a_2 < a_3 < \dots$ . It is called **decreasing** if  $a_n > a_{n+1}$  for all  $n \geq 1$ . A sequence is called **monotonic** if it is either increasing or decreasing.

**EXAMPLE 12** The sequence  $\left\{\frac{3}{n+5}\right\}$  is decreasing because

In Example 12,  $3/(n+6)$  is smaller than  $3/(n+5)$  because its denominator is larger.

$$a_n = \frac{3}{n+5} > \frac{3}{n+6} = \frac{3}{(n+1)+5} = a_{n+1}$$

for all  $n \geq 1$ .

**EXAMPLE 13** Show that the sequence  $a_n = \frac{n}{n^2 + 1}$  is decreasing.

**SOLUTION 1** We must show that  $a_n > a_{n+1}$ , that is,

$$\frac{n}{n^2 + 1} > \frac{n+1}{(n+1)^2 + 1}$$

This inequality is equivalent to the one we get by cross-multiplication:

$$\begin{aligned}\frac{n}{n^2 + 1} > \frac{n + 1}{(n + 1)^2 + 1} &\iff n[(n + 1)^2 + 1] > (n + 1)(n^2 + 1) \\ &\iff n^3 + 2n^2 + 2n > n^3 + n^2 + n + 1 \\ &\iff n^2 + n > 1\end{aligned}$$

Since  $n \geq 1$ , we know that the inequality  $n^2 + n > 1$  is true. Therefore  $a_n > a_{n+1}$  and so  $\{a_n\}$  is decreasing.

**SOLUTION 2** Consider the function  $f(x) = \frac{x}{x^2 + 1}$ :

$$f'(x) = \frac{x^2 + 1 - x \cdot 2x}{(x^2 + 1)^2} = \frac{1 - x^2}{(x^2 + 1)^2} < 0 \quad \text{whenever } x^2 > 1$$

Thus  $f$  is decreasing on  $(1, \infty)$  and so  $f(n) > f(n + 1)$ . Therefore  $\{a_n\}$  is decreasing. ■

**11 Definition** A sequence  $\{a_n\}$  is **bounded above** if there is a number  $M$  such that

$$a_n \leq M \quad \text{for all } n \geq 1$$

A sequence is **bounded below** if there is a number  $m$  such that

$$m \leq a_n \quad \text{for all } n \geq 1$$

If a sequence is bounded above and below, then it is called a **bounded sequence**.

For instance, the sequence  $a_n = n$  is bounded below ( $a_n > 0$ ) but not above. The sequence  $a_n = n/(n + 1)$  is bounded because  $0 < a_n < 1$  for all  $n$ .

We know that not every bounded sequence is convergent [for instance, the sequence  $a_n = (-1)^n$  satisfies  $-1 \leq a_n \leq 1$  but is divergent from Example 7] and not every monotonic sequence is convergent ( $a_n = n \rightarrow \infty$ ). But if a sequence is both bounded *and* monotonic, then it must be convergent. This fact is proved as Theorem 12, but intuitively you can understand why it is true by looking at Figure 14. If  $\{a_n\}$  is increasing and  $a_n \leq M$  for all  $n$ , then the terms are forced to crowd together and approach some number  $L$ .

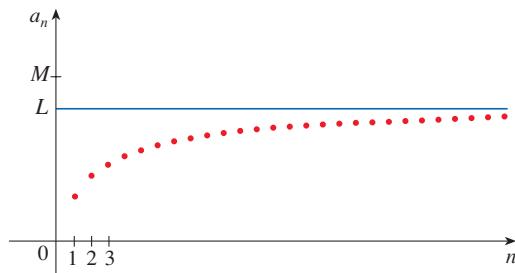

FIGURE 14

**12 Monotonic Sequence Theorem** Every bounded, monotonic sequence is convergent.

In particular, a sequence that is increasing and bounded above converges, and a sequence that is decreasing and bounded below converges.

The proof of Theorem 12 is based on the **Completeness Axiom** for the set  $\mathbb{R}$  of real numbers, which says that if  $S$  is a nonempty set of real numbers that has an upper bound  $M$  ( $x \leq M$  for all  $x$  in  $S$ ), then  $S$  has a **least upper bound**  $b$ . (This means that  $b$  is an upper bound for  $S$ , but if  $M$  is any other upper bound, then  $b \leq M$ .) The Completeness Axiom is an expression of the fact that there is no gap or hole in the real number line.

**PROOF OF THEOREM 12** Suppose  $\{a_n\}$  is an increasing sequence. Since  $\{a_n\}$  is bounded, the set  $S = \{a_n \mid n \geq 1\}$  has an upper bound. By the Completeness Axiom it has a least upper bound  $L$ . Given  $\varepsilon > 0$ ,  $L - \varepsilon$  is *not* an upper bound for  $S$  (since  $L$  is the *least* upper bound). Therefore

$$a_N > L - \varepsilon \quad \text{for some integer } N$$

But the sequence is increasing so  $a_n \geq a_N$  for every  $n > N$ . Thus if  $n > N$ , we have

$$a_n > L - \varepsilon$$

$$\text{so} \quad 0 \leq L - a_n < \varepsilon$$

since  $a_n \leq L$ . Thus

$$|L - a_n| < \varepsilon \quad \text{whenever } n > N$$

so  $\lim_{n \rightarrow \infty} a_n = L$ .

A similar proof (using the greatest lower bound) holds if  $\{a_n\}$  is decreasing. ■

**EXAMPLE 14** Investigate the sequence  $\{a_n\}$  defined by the *recurrence relation*

$$a_1 = 2 \quad a_{n+1} = \frac{1}{2}(a_n + 6) \quad \text{for } n = 1, 2, 3, \dots$$

**SOLUTION** We begin by computing the first several terms:

$$\begin{array}{lll} a_1 = 2 & a_2 = \frac{1}{2}(2 + 6) = 4 & a_3 = \frac{1}{2}(4 + 6) = 5 \\ a_4 = \frac{1}{2}(5 + 6) = 5.5 & a_5 = 5.75 & a_6 = 5.875 \\ a_7 = 5.9375 & a_8 = 5.96875 & a_9 = 5.984375 \end{array}$$

These initial terms suggest that the sequence is increasing and the terms are approaching 6. To confirm that the sequence is increasing, we use mathematical induction to show that  $a_{n+1} > a_n$  for all  $n \geq 1$ . This is true for  $n = 1$  because  $a_2 = 4 > a_1$ . If we assume that it is true for  $n = k$ , then we have

$$a_{k+1} > a_k$$

$$\text{so} \quad a_{k+1} + 6 > a_k + 6$$

$$\text{and} \quad \frac{1}{2}(a_{k+1} + 6) > \frac{1}{2}(a_k + 6)$$

$$\text{Thus} \quad a_{k+2} > a_{k+1}$$

We have deduced that  $a_{n+1} > a_n$  is true for  $n = k + 1$ . Therefore the inequality is true for all  $n$  by induction.

Next we verify that  $\{a_n\}$  is bounded by showing that  $a_n < 6$  for all  $n$ . (Since the sequence is increasing, we already know that it has a lower bound:  $a_n \geq a_1 = 2$  for

Mathematical induction is often used in dealing with recursive sequences. See Principles of Problem Solving following Chapter 1 for a discussion of the Principle of Mathematical Induction.

all  $n$ .) We know that  $a_1 < 6$ , so the assertion is true for  $n = 1$ . Suppose it is true for  $n = k$ . Then

$$a_k < 6$$

so

$$a_k + 6 < 12$$

and

$$\frac{1}{2}(a_k + 6) < \frac{1}{2}(12) = 6$$

Thus

$$a_{k+1} < 6$$

This shows, by mathematical induction, that  $a_n < 6$  for all  $n$ .

Since the sequence  $\{a_n\}$  is increasing and bounded, Theorem 12 guarantees that it has a limit. The theorem doesn't tell us what the value of the limit is. But now that we know  $L = \lim_{n \rightarrow \infty} a_n$  exists, we can use the given recurrence relation to write

$$\lim_{n \rightarrow \infty} a_{n+1} = \lim_{n \rightarrow \infty} \frac{1}{2}(a_n + 6) = \frac{1}{2} \left( \lim_{n \rightarrow \infty} a_n + 6 \right) = \frac{1}{2}(L + 6)$$

A proof of this fact is requested in Exercise 76.

Since  $a_n \rightarrow L$ , it follows that  $a_{n+1} \rightarrow L$  too (as  $n \rightarrow \infty$ ,  $n + 1 \rightarrow \infty$  also). So we have

$$L = \frac{1}{2}(L + 6)$$

Solving this equation for  $L$ , we get  $L = 6$ , as we predicted. ■

## 11.1 | EXERCISES

1. (a) What is a sequence?  
 (b) What does it mean to say that  $\lim_{n \rightarrow \infty} a_n = 8$ ?  
 (c) What does it mean to say that  $\lim_{n \rightarrow \infty} a_n = \infty$ ?
2. (a) What is a convergent sequence? Give two examples.  
 (b) What is a divergent sequence? Give two examples.

**3–16** List the first five terms of the sequence.

3.  $a_n = n^3 - 1$

4.  $a_n = \frac{1}{3^n + 1}$

5.  $\{2^n + n\}_{n=2}^{\infty}$

6.  $\left\{ \frac{n^2 - 1}{n^2 + 1} \right\}_{n=3}^{\infty}$

7.  $a_n = \frac{(-1)^{n-1}}{n^2}$

8.  $a_n = \frac{(-1)^n}{4^n}$

9.  $a_n = \cos n\pi$

10.  $a_n = 1 + (-1)^n$

11.  $a_n = \frac{(-2)^n}{(n + 1)!}$

12.  $a_n = \frac{2n + 1}{n! + 1}$

13.  $a_1 = 1, a_{n+1} = 2a_n + 1$

14.  $a_1 = 6, a_{n+1} = \frac{a_n}{n}$

15.  $a_1 = 2, a_{n+1} = \frac{a_n}{1 + a_n}$

16.  $a_1 = 2, a_2 = 1, a_{n+1} = a_n - a_{n-1}$

**17–22** Find a formula for the general term  $a_n$  of the sequence, assuming that the pattern of the first few terms continues.

17.  $\left\{ \frac{1}{2}, \frac{1}{4}, \frac{1}{6}, \frac{1}{8}, \frac{1}{10}, \dots \right\}$

18.  $\left\{ 4, -1, \frac{1}{4}, -\frac{1}{16}, \frac{1}{64}, \dots \right\}$

19.  $\left\{ -3, 2, -\frac{4}{3}, \frac{8}{9}, -\frac{16}{27}, \dots \right\}$

20.  $\{5, 8, 11, 14, 17, \dots\}$

21.  $\left\{ \frac{1}{2}, -\frac{4}{3}, \frac{9}{4}, -\frac{16}{5}, \frac{25}{6}, \dots \right\}$

22.  $\{1, 0, -1, 0, 1, 0, -1, 0, \dots\}$

**23–26** Calculate, to four decimal places, the first ten terms of the sequence and use them to plot the graph of the sequence by hand. Does the sequence appear to have a limit? If so, calculate it. If not, explain why.

23.  $a_n = \frac{3n}{1 + 6n}$

24.  $a_n = 2 + \frac{(-1)^n}{n}$

25.  $a_n = 1 + \left(-\frac{1}{2}\right)^n$

26.  $a_n = 1 + \frac{10^n}{9^n}$

**27–62** Determine whether the sequence converges or diverges. If it converges, find the limit.

27.  $a_n = \frac{5}{n + 2}$

28.  $a_n = 5\sqrt{n + 2}$

29.  $a_n = \frac{4n^2 - 3n}{2n^2 + 1}$

30.  $a_n = \frac{4n^2 - 3n}{2n + 1}$

31.  $a_n = \frac{n^4}{n^3 - 2n}$

32.  $a_n = 2 + (0.86)^n$

33.  $a_n = 3^n 7^{-n}$

34.  $a_n = \frac{3\sqrt{n}}{\sqrt{n} + 2}$

35.  $a_n = e^{-1/\sqrt{n}}$

36.  $a_n = \frac{4^n}{1 + 9^n}$

37.  $a_n = \sqrt{\frac{1 + 4n^2}{1 + n^2}}$

38.  $a_n = \cos\left(\frac{n\pi}{n + 1}\right)$

39.  $a_n = \frac{n^2}{\sqrt{n^3 + 4n}}$

40.  $a_n = e^{2n/(n+2)}$

41.  $a_n = \frac{(-1)^n}{2\sqrt{n}}$

42.  $a_n = \frac{(-1)^{n+1}n}{n + \sqrt{n}}$

43.  $\left\{ \frac{(2n-1)!}{(2n+1)!} \right\}$

44.  $\left\{ \frac{\ln n}{\ln(2n)} \right\}$

45.  $\{\sin n\}$

46.  $a_n = \frac{\tan^{-1} n}{n}$

47.  $\{n^2 e^{-n}\}$

48.  $a_n = \ln(n+1) - \ln n$

49.  $a_n = \frac{\cos^2 n}{2^n}$

50.  $a_n = \sqrt[n]{2^{1+3n}}$

51.  $a_n = n \sin(1/n)$

52.  $a_n = 2^{-n} \cos n\pi$

53.  $a_n = \left(1 + \frac{2}{n}\right)^n$

54.  $a_n = n^{1/n}$

55.  $a_n = \ln(2n^2 + 1) - \ln(n^2 + 1)$

56.  $a_n = \frac{(\ln n)^2}{n}$

57.  $a_n = \arctan(\ln n)$

58.  $a_n = n - \sqrt{n+1}\sqrt{n+3}$

59.  $\{0, 1, 0, 0, 1, 0, 0, 0, 1, \dots\}$

60.  $\left\{ \frac{1}{1}, \frac{1}{3}, \frac{1}{2}, \frac{1}{4}, \frac{1}{3}, \frac{1}{5}, \frac{1}{4}, \frac{1}{6}, \dots \right\}$

61.  $a_n = \frac{n!}{2^n}$

62.  $a_n = \frac{(-3)^n}{n!}$

 **63–69** Use a graph of the sequence to decide whether the sequence is convergent or divergent. If the sequence is convergent, guess the value of the limit from the graph and then prove your guess.

63.  $a_n = (-1)^n \frac{n}{n + 1}$

64.  $a_n = \frac{\sin n}{n}$

65.  $a_n = \arctan\left(\frac{n^2}{n^2 + 4}\right)$

66.  $a_n = \sqrt[n]{3^n + 5^n}$

67.  $a_n = \frac{n^2 \cos n}{1 + n^2}$

68.  $a_n = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{n!}$

69.  $a_n = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{(2n)^n}$

- 70.** (a) Determine whether the sequence defined as follows is convergent or divergent:

$$a_1 = 1 \quad a_{n+1} = 4 - a_n \quad \text{for } n \geq 1$$

- (b) What happens if the first term is  $a_1 = 2$ ?

- 71.** If \$1000 is invested at 6% interest, compounded annually, then after  $n$  years the investment is worth  $a_n = 1000(1.06)^n$  dollars.

- (a) Find the first five terms of the sequence  $\{a_n\}$ .  
 (b) Is the sequence convergent or divergent? Explain.

- 72.** If you deposit \$100 at the end of every month into an account that pays 3% interest per year compounded monthly, the amount of interest accumulated after  $n$  months is given by the sequence

$$I_n = 100 \left( \frac{1.0025^n - 1}{0.0025} - n \right)$$

- (a) Find the first six terms of the sequence.  
 (b) How much interest will you have earned after two years?

- 73.** A fish farmer has 5000 catfish in his pond. The number of catfish increases by 8% per month and the farmer harvests 300 catfish per month.

- (a) Show that the catfish population  $P_n$  after  $n$  months is given recursively by

$$P_n = 1.08P_{n-1} - 300 \quad P_0 = 5000$$

- (b) Find the number of catfish in the pond after six months.

- 74.** Find the first 40 terms of the sequence defined by

$$a_{n+1} = \begin{cases} \frac{1}{2}a_n & \text{if } a_n \text{ is an even number} \\ 3a_n + 1 & \text{if } a_n \text{ is an odd number} \end{cases}$$

and  $a_1 = 11$ . Do the same if  $a_1 = 25$ . Make a conjecture about this type of sequence.

- 75.** For what values of  $r$  is the sequence  $\{nr^n\}$  convergent?

- 76.** (a) If  $\{a_n\}$  is convergent, show that

$$\lim_{n \rightarrow \infty} a_{n+1} = \lim_{n \rightarrow \infty} a_n$$

- (b) A sequence  $\{a_n\}$  is defined by  $a_1 = 1$  and  $a_{n+1} = 1/(1 + a_n)$  for  $n \geq 1$ . Assuming that  $\{a_n\}$  is convergent, find its limit.

- 77.** Suppose you know that  $\{a_n\}$  is a decreasing sequence and all its terms lie between the numbers 5 and 8. Explain why

the sequence has a limit. What can you say about the value of the limit?

**78–84** Determine whether the sequence is increasing, decreasing, or not monotonic. Is the sequence bounded?

**78.**  $a_n = \cos n$

**79.**  $a_n = \frac{1}{2n+3}$

**81.**  $a_n = n(-1)^n$

**83.**  $a_n = 3 - 2ne^{-n}$

**80.**  $a_n = \frac{1-n}{2+n}$

**82.**  $a_n = 2 + \frac{(-1)^n}{n}$

**84.**  $a_n = n^3 - 3n + 3$

**85.** Find the limit of the sequence

$$\left\{ \sqrt{2}, \sqrt{2\sqrt{2}}, \sqrt{2\sqrt{2\sqrt{2}}}, \dots \right\}$$

**86.** A sequence  $\{a_n\}$  is given by  $a_1 = \sqrt{2}$ ,  $a_{n+1} = \sqrt{2 + a_n}$ .

(a) By induction or otherwise, show that  $\{a_n\}$  is increasing and bounded above by 3. Apply the Monotonic Sequence Theorem to show that  $\lim_{n \rightarrow \infty} a_n$  exists.

(b) Find  $\lim_{n \rightarrow \infty} a_n$ .

**87.** Show that the sequence defined by

$$a_1 = 1 \quad a_{n+1} = 3 - \frac{1}{a_n}$$

is increasing and  $a_n < 3$  for all  $n$ . Deduce that  $\{a_n\}$  is convergent and find its limit.

**88.** Show that the sequence defined by

$$a_1 = 2 \quad a_{n+1} = \frac{1}{3 - a_n}$$

satisfies  $0 < a_n \leq 2$  and is decreasing. Deduce that the sequence is convergent and find its limit.

**89.** (a) Fibonacci posed the following problem:

Suppose that rabbits live forever and that every month each pair produces a new pair which becomes productive at age 2 months. If we start with one newborn pair, how many pairs of rabbits will we have in the  $n$ th month?

Show that the answer is  $f_n$ , where  $\{f_n\}$  is the Fibonacci sequence defined in Example 3(c).

(b) Let  $a_n = f_{n+1}/f_n$  and show that  $a_{n-1} = 1 + 1/a_{n-2}$ . Assuming that  $\{a_n\}$  is convergent, find its limit.

**90.** (a) Let  $a_1 = a$ ,  $a_2 = f(a)$ ,  $a_3 = f(a_2) = f(f(a))$ ,  $\dots$ ,  $a_{n+1} = f(a_n)$ , where  $f$  is a continuous function. If  $\lim_{n \rightarrow \infty} a_n = L$ , show that  $f(L) = L$ .

(b) Illustrate part (a) by taking  $f(x) = \cos x$ ,  $a = 1$ , and estimating the value of  $L$  to five decimal places.

 **91.** (a) Use a graph to guess the value of the limit

$$\lim_{n \rightarrow \infty} \frac{n^5}{n!}$$

(b) Use a graph of the sequence in part (a) to find the smallest values of  $N$  that correspond to  $\varepsilon = 0.1$  and  $\varepsilon = 0.001$  in Definition 2.

**92.** Use Definition 2 directly to prove that  $\lim_{n \rightarrow \infty} r^n = 0$  when  $|r| < 1$ .

**93.** Prove Theorem 6.

[Hint: Use either Definition 2 or the Squeeze Theorem.]

**94.** Use Theorem 7 to prove the Power Law:

$$\lim_{n \rightarrow \infty} a_n^p = \left[ \lim_{n \rightarrow \infty} a_n \right]^p \quad \text{if } p > 0 \text{ and } a_n > 0$$

**95.** Prove that if  $\lim_{n \rightarrow \infty} a_n = 0$  and  $\{b_n\}$  is bounded, then  $\lim_{n \rightarrow \infty} (a_n b_n) = 0$ .

**96.** Let  $a_n = (1 + 1/n)^n$ .

(a) Show that if  $0 \leq a < b$ , then

$$\frac{b^{n+1} - a^{n+1}}{b - a} < (n + 1)b^n$$

(b) Deduce that  $b^n[(n + 1)a - nb] < a^{n+1}$ .

(c) Use  $a = 1 + 1/(n + 1)$  and  $b = 1 + 1/n$  in part (b) to show that  $\{a_n\}$  is increasing.

(d) Use  $a = 1$  and  $b = 1 + 1/(2n)$  in part (b) to show that  $a_{2n} < 4$ .

(e) Use parts (c) and (d) to show that  $a_n < 4$  for all  $n$ .

(f) Use Theorem 12 to show that  $\lim_{n \rightarrow \infty} (1 + 1/n)^n$  exists. (The limit is  $e$ . See Equation 3.6.6.)

**97.** Let  $a$  and  $b$  be positive numbers with  $a > b$ . Let  $a_1$  be their arithmetic mean and  $b_1$  their geometric mean:

$$a_1 = \frac{a+b}{2} \quad b_1 = \sqrt{ab}$$

Repeat this process so that, in general,

$$a_{n+1} = \frac{a_n + b_n}{2} \quad b_{n+1} = \sqrt{a_n b_n}$$

(a) Use mathematical induction to show that

$$a_n > a_{n+1} > b_{n+1} > b_n$$

(b) Deduce that both  $\{a_n\}$  and  $\{b_n\}$  are convergent.

(c) Show that  $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} b_n$ . Gauss called the common value of these limits the **arithmetic-geometric mean** of the numbers  $a$  and  $b$ .

**98.** (a) Show that if  $\lim_{n \rightarrow \infty} a_{2n} = L$  and  $\lim_{n \rightarrow \infty} a_{2n+1} = L$ , then  $\{a_n\}$  is convergent and  $\lim_{n \rightarrow \infty} a_n = L$ .

(b) If  $a_1 = 1$  and

$$a_{n+1} = 1 + \frac{1}{1 + a_n}$$

find the first eight terms of the sequence  $\{a_n\}$ . Then use

part (a) to show that  $\lim_{n \rightarrow \infty} a_n = \sqrt{2}$ . This gives the **continued fraction expansion**

$$\sqrt{2} = 1 + \cfrac{1}{2 + \cfrac{1}{2 + \dots}}$$

99. The size of an undisturbed fish population has been modeled by the formula

$$p_{n+1} = \frac{bp_n}{a + p_n}$$

where  $p_n$  is the fish population after  $n$  years and  $a$  and  $b$  are

positive constants that depend on the species and its environment. Suppose that the population in year 0 is  $p_0 > 0$ .

- Show that if  $\{p_n\}$  is convergent, then the only possible values for its limit are 0 and  $b - a$ .
- Show that  $p_{n+1} < (b/a)p_n$ .
- Use part (b) to show that if  $a > b$ , then  $\lim_{n \rightarrow \infty} p_n = 0$ ; in other words, the population dies out.
- Now assume that  $a < b$ . Show that if  $p_0 < b - a$ , then  $\{p_n\}$  is increasing and  $0 < p_n < b - a$ . Also show that if  $p_0 > b - a$ , then  $\{p_n\}$  is decreasing and  $p_n > b - a$ . Deduce that if  $a < b$ , then  $\lim_{n \rightarrow \infty} p_n = b - a$ .

## DISCOVERY PROJECT

## T LOGISTIC SEQUENCES

A sequence that arises in ecology as a model for population growth is defined by the **logistic difference equation**

$$p_{n+1} = kp_n(1 - p_n)$$

where  $p_n$  measures the size of the population of the  $n$ th generation of a single species. To keep the numbers manageable, we take  $p_n$  to be a fraction of the maximal size of the population, so  $0 \leq p_n \leq 1$ . Notice that the form of this equation is similar to the logistic differential equation in Section 9.4. The discrete model—with sequences instead of continuous functions—is preferable for modeling insect populations, where mating and death occur in a periodic fashion.

An ecologist is interested in predicting the size of the population as time goes on, and asks these questions: Will it stabilize at a limiting value? Will it change in a cyclical fashion? Or will it exhibit random behavior?

Write a program to compute the first  $n$  terms of this sequence starting with an initial population  $p_0$ , where  $0 < p_0 < 1$ . Use this program to do the following.

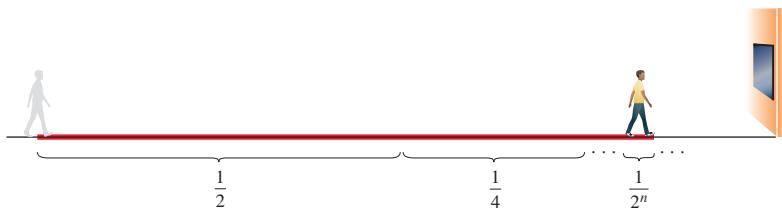

- Calculate 20 or 30 terms of the sequence for  $p_0 = \frac{1}{2}$  and for two values of  $k$  such that  $1 < k < 3$ . Graph each sequence. Do the sequences appear to converge? Repeat for a different value of  $p_0$  between 0 and 1. Does the limit depend on the choice of  $p_0$ ? Does it depend on the choice of  $k$ ?
- Calculate terms of the sequence for a value of  $k$  between 3 and 3.4 and plot them. What do you notice about the behavior of the terms?
- Experiment with values of  $k$  between 3.4 and 3.5. What happens to the terms?
- For values of  $k$  between 3.6 and 4, compute and plot at least 100 terms and comment on the behavior of the sequence. What happens if you change  $p_0$  by 0.001? This type of behavior is called *chaotic* and is exhibited by insect populations under certain conditions.

## 11.2 | Series

Recall from Section 11.1 that Zeno, in one of his paradoxes, observed that in order for a man standing in a room to walk to a wall, he would first have to walk half the distance to the wall, then half the remaining distance ( $\frac{1}{4}$  of the total), and then again half of what still

remains ( $\frac{1}{8}$ ), and so on (see Figure 1). Because this process can always be continued, Zeno argued that the man can never reach the wall.

**FIGURE 1**  
At the  $n$ th stage, the man has walked a total distance of  
$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^n}$$

Of course, we know that the man can actually reach the wall, so this suggests that perhaps the total distance the man walks can be expressed as the sum of infinitely many smaller distances as follows:

$$1 = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots + \frac{1}{2^n} + \cdots$$

Zeno was arguing that it doesn't make sense to add infinitely many numbers together. But there are other situations in which we implicitly use infinite sums. For instance, in decimal notation, the value of  $\pi$  is

$$\pi = 3.14159\ 26535\ 89793\ 23846\ 26433\ 83279\ 50288\ \dots$$

The convention behind our decimal notation is that this number can be written as the infinite sum

$$\pi = 3 + \frac{1}{10} + \frac{4}{10^2} + \frac{1}{10^3} + \frac{5}{10^4} + \frac{9}{10^5} + \frac{2}{10^6} + \frac{6}{10^7} + \frac{5}{10^8} + \cdots$$

We can't literally add an infinite number of terms, but the more terms we add, the closer we get to the actual value of  $\pi$ .

## ■ Infinite Series

If we try to add the terms of an infinite sequence  $\{a_n\}_{n=1}^{\infty}$  we get an expression of the form

$$1 \quad a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$

which is called an **infinite series** (or just a **series**) and is denoted by the symbol

$$\sum_{n=1}^{\infty} a_n \quad \text{or} \quad \sum a_n$$

In general, does it make sense to talk about the sum of infinitely many numbers? For example, it would be impossible to find a finite sum for the series

$$1 + 2 + 3 + 4 + 5 + \cdots + n + \cdots$$

because if we start adding the terms, then we get cumulative sums that grow increasingly larger.

However, consider the series of distances from Zeno's paradox:

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \frac{1}{64} + \cdots + \frac{1}{2^n} + \cdots$$

<i>n</i>	Sum of first <i>n</i> terms
1	0.50000000
2	0.75000000
3	0.87500000
4	0.93750000
5	0.96875000
6	0.98437500
7	0.99218750
10	0.99902344
15	0.99996948
20	0.99999905
25	0.99999997

If we start adding the terms, and we keep track of the subtotals as we go, we get  $\frac{1}{2}, \frac{3}{4}$  (the sum of the first two terms),  $\frac{7}{8}$  (first three terms),  $\frac{15}{16}, \frac{31}{32}, \frac{63}{64}$ , and so on. The table in the margin shows that as we add more and more terms, these *partial sums* become closer and closer to 1. In fact, you can verify that the *n*th partial sum is given by

$$\frac{2^n - 1}{2^n} = 1 - \frac{1}{2^n}$$

and we can see that by adding sufficiently many terms of the series (making *n* sufficiently large), the partial sums can be made as close to 1 as we like. So it seems reasonable to say that the sum of this infinite series is 1 and to write

$$\sum_{n=1}^{\infty} \frac{1}{2^n} = \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots + \frac{1}{2^n} + \cdots = 1$$

We use a similar idea to determine whether or not a general series  $\Sigma a_n$  has a sum. We consider the **partial sums**

$$s_1 = a_1$$

$$s_2 = a_1 + a_2$$

$$s_3 = a_1 + a_2 + a_3$$

$$s_4 = a_1 + a_2 + a_3 + a_4$$

and, in general,

$$s_n = a_1 + a_2 + a_3 + \cdots + a_n = \sum_{i=1}^n a_i$$

These partial sums form a new sequence  $\{s_n\}$ , which may or may not have a limit. If  $\lim_{n \rightarrow \infty} s_n$  exists (as a finite number), then we call it the sum of the infinite series  $\Sigma a_n$ .

**2 Definition** Given a series  $\sum_{n=1}^{\infty} a_n = a_1 + a_2 + a_3 + \cdots$ , let  $s_n$  denote its *n*th partial sum:

$$s_n = \sum_{i=1}^n a_i = a_1 + a_2 + \cdots + a_n$$

If the sequence  $\{s_n\}$  is convergent and  $\lim_{n \rightarrow \infty} s_n = s$  exists as a real number, then the series  $\Sigma a_n$  is called **convergent** and we write

$$a_1 + a_2 + \cdots + a_n + \cdots = s \quad \text{or} \quad \sum_{n=1}^{\infty} a_n = s$$

The number *s* is called the **sum** of the series.

If the sequence  $\{s_n\}$  is divergent, then the series is called **divergent**.

Compare with the improper integral

$$\int_1^{\infty} f(x) dx = \lim_{t \rightarrow \infty} \int_1^t f(x) dx$$

To find this integral we integrate from 1 to *t* and then let *t*  $\rightarrow \infty$ . For a series, we sum from 1 to *n* and then let *n*  $\rightarrow \infty$ .

Thus the sum of a series is the limit of the sequence of partial sums. So when we write  $\sum_{n=1}^{\infty} a_n = s$ , we mean that by adding sufficiently many terms of the series we can get as close as we like to the number *s*. Notice that

$$\sum_{n=1}^{\infty} a_n = \lim_{n \rightarrow \infty} \sum_{i=1}^n a_i$$

**EXAMPLE 1** Suppose we know that the sum of the first  $n$  terms of the series  $\sum_{n=1}^{\infty} a_n$  is

$$s_n = a_1 + a_2 + \cdots + a_n = \frac{2n}{3n+5}$$

Then the sum of the series is the limit of the sequence  $\{s_n\}$ :

$$\sum_{n=1}^{\infty} a_n = \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{2n}{3n+5} = \lim_{n \rightarrow \infty} \frac{2}{3 + \frac{5}{n}} = \frac{2}{3}$$
■

In Example 1 we were *given* an expression for the sum of the first  $n$  terms. In the following example we will *find* an expression for the  $n$ th partial sum.

**EXAMPLE 2** Show that the series  $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$  is convergent, and find its sum.

**SOLUTION** We use the definition of a convergent series and compute the partial sums.

$$s_n = \sum_{i=1}^n \frac{1}{i(i+1)} = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{n(n+1)}$$

We can simplify this expression if we use the partial fraction decomposition

$$\frac{1}{i(i+1)} = \frac{1}{i} - \frac{1}{i+1}$$

(see Section 7.4). Thus we have

$$\begin{aligned} s_n &= \sum_{i=1}^n \frac{1}{i(i+1)} = \sum_{i=1}^n \left( \frac{1}{i} - \frac{1}{i+1} \right) \\ &= \left( 1 - \frac{1}{2} \right) + \left( \frac{1}{2} - \frac{1}{3} \right) + \left( \frac{1}{3} - \frac{1}{4} \right) + \cdots + \left( \frac{1}{n} - \frac{1}{n+1} \right) \\ &= 1 - \frac{1}{n+1} \end{aligned}$$

and so  $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left( 1 - \frac{1}{n+1} \right) = 1 - 0 = 1$

Therefore the given series is convergent and

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = 1$$
■

Notice that the terms cancel in pairs. This is an example of a **telescoping sum**: because of all the cancellations, the sum collapses (like a pirate's collapsing telescope) into just two terms.

Figure 2 illustrates Example 2 by showing the graphs of the sequence of terms  $a_n = 1/[n(n+1)]$  and the sequence  $\{s_n\}$  of partial sums. Notice that  $a_n \rightarrow 0$  and  $s_n \rightarrow 1$ . See Exercises 82 and 83 for two geometric interpretations of Example 2.

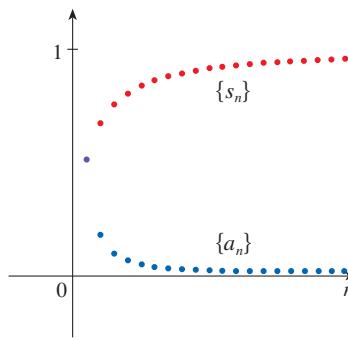

FIGURE 2

## ■ Sum of a Geometric Series

An important example of an infinite series is the **geometric series**

$$a + ar + ar^2 + ar^3 + \cdots + ar^{n-1} + \cdots = \sum_{n=1}^{\infty} ar^{n-1} \quad a \neq 0$$

Each term is obtained from the preceding one by multiplying it by the **common ratio**  $r$ . (The series that arises from Zeno's paradox is the special case where  $a = \frac{1}{2}$  and  $r = \frac{1}{2}$ .)

If  $r = 1$ , then  $s_n = a + a + \cdots + a = na \rightarrow \pm\infty$ . Since  $\lim_{n \rightarrow \infty} s_n$  doesn't exist, the geometric series diverges in this case.

If  $r \neq 1$ , we have

$$s_n = a + ar + ar^2 + \cdots + ar^{n-1}$$

and

$$rs_n = ar + ar^2 + \cdots + ar^{n-1} + ar^n$$

Subtracting these equations, we get

$$s_n - rs_n = a - ar^n$$

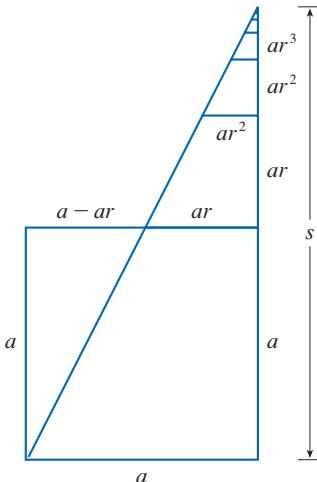

$$\boxed{3} \quad s_n = \frac{a(1 - r^n)}{1 - r}$$

If  $-1 < r < 1$ , we know from (11.1.9) that  $r^n \rightarrow 0$  as  $n \rightarrow \infty$ , so

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{a(1 - r^n)}{1 - r} = \frac{a}{1 - r} - \frac{a}{1 - r} \cdot \lim_{n \rightarrow \infty} r^n = \frac{a}{1 - r}$$

Thus when  $|r| < 1$  the geometric series is convergent and its sum is  $a/(1 - r)$ .

If  $r \leq -1$  or  $r > 1$ , the sequence  $\{r^n\}$  is divergent by (11.1.9) and so, by Equation 3,  $\lim_{n \rightarrow \infty} s_n$  does not exist. Therefore the geometric series diverges in those cases. We summarize these results as follows.

**FIGURE 3**

In words: the sum of a convergent geometric series is

$$\frac{\text{first term}}{1 - \text{common ratio}}$$

### 4 The geometric series

$$\sum_{n=1}^{\infty} ar^{n-1} = a + ar + ar^2 + \cdots$$

is convergent if  $|r| < 1$  and its sum is

$$\sum_{n=1}^{\infty} ar^{n-1} = \frac{a}{1 - r} \quad |r| < 1$$

If  $|r| \geq 1$ , the geometric series is divergent.

### EXAMPLE 3 Find the sum of the geometric series

$$5 - \frac{10}{3} + \frac{20}{9} - \frac{40}{27} + \cdots$$

**SOLUTION** The first term is  $a = 5$  and the common ratio is  $r = -\frac{2}{3}$ . Since  $|r| = \frac{2}{3} < 1$ , the series is convergent by (4) and its sum is

$$\frac{5}{1 - (-\frac{2}{3})} = \frac{5}{\frac{5}{3}} = 3$$

What do we really mean when we say that the sum of the series in Example 3 is 3? Of course, we can't literally add an infinite number of terms, one by one. But, according to Definition 2, the total sum is the limit of the sequence of partial sums. So, by taking the sum of sufficiently many terms, we can get as close as we like to the number 3. The table shows the first 10 partial sums  $s_n$  and the graph in Figure 4 shows how the sequence of partial sums approaches 3.

$n$	$s_n$
1	5.000000
2	1.666667
3	3.888889
4	2.407407
5	3.395062
6	2.736626
7	3.175583
8	2.882945
9	3.078037
10	2.947975

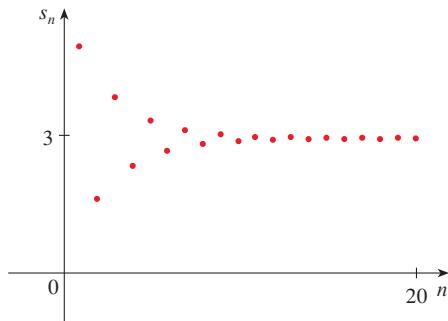

FIGURE 4

**EXAMPLE 4** Is the series  $\sum_{n=1}^{\infty} 2^{2n}3^{1-n}$  convergent or divergent?

**SOLUTION** Let's rewrite the  $n$ th term of the series in the form  $ar^{n-1}$ :

$$\sum_{n=1}^{\infty} 2^{2n}3^{1-n} = \sum_{n=1}^{\infty} (2^2)^n 3^{1-(n-1)} = \sum_{n=1}^{\infty} \frac{4^n}{3^{n-1}} = \sum_{n=1}^{\infty} 4\left(\frac{4}{3}\right)^{n-1}$$

We recognize this series as a geometric series with  $a = 4$  and  $r = \frac{4}{3}$ . Since  $r > 1$ , the series diverges by (4). ■

**EXAMPLE 5** A drug is administered to a patient at the same time every day. Suppose the concentration of the drug is  $C_n$  (measured in mg/mL) after the injection on the  $n$ th day. Before the injection the next day, only 30% of the drug remains in the bloodstream and the daily dose raises the concentration by 0.2 mg/mL.

- Find the concentration just after the third injection.
- What is the concentration just after the  $n$ th dose?
- What is the limiting concentration?

**SOLUTION**

(a) Just before the daily dose of medication is administered, the concentration is reduced to 30% of the preceding day's concentration, that is,  $0.3C_n$ . With the new dose, the concentration is increased by 0.2 mg/mL and so

$$C_{n+1} = 0.2 + 0.3C_n$$

Starting with  $C_0 = 0$  and putting  $n = 0, 1, 2$  into this equation, we get

$$C_1 = 0.2 + 0.3C_0 = 0.2$$

$$C_2 = 0.2 + 0.3C_1 = 0.2 + 0.2(0.3) = 0.26$$

$$C_3 = 0.2 + 0.3C_2 = 0.2 + 0.2(0.3) + 0.2(0.3)^2 = 0.278$$

The concentration after three days is 0.278 mg/mL.

(b) After the  $n$ th dose the concentration is

$$C_n = 0.2 + 0.2(0.3) + 0.2(0.3)^2 + \cdots + 0.2(0.3)^{n-1}$$

This is a finite geometric series with  $a = 0.2$  and  $r = 0.3$ , so by Formula 3 we have

$$C_n = \frac{0.2[1 - (0.3)^n]}{1 - 0.3} = \frac{2}{7}[1 - (0.3)^n] \text{ mg/mL}$$

(c) Because  $0.3 < 1$ , we know that  $\lim_{n \rightarrow \infty} (0.3)^n = 0$ . So the limiting concentration is

$$\lim_{n \rightarrow \infty} C_n = \lim_{n \rightarrow \infty} \frac{2}{7}[1 - (0.3)^n] = \frac{2}{7}(1 - 0) = \frac{2}{7} \text{ mg/mL} \quad \blacksquare$$

**EXAMPLE 6** Write the number  $2.\overline{317} = 2.3171717\ldots$  as a ratio of integers.

**SOLUTION**

$$2.3171717\ldots = 2.3 + \frac{17}{10^3} + \frac{17}{10^5} + \frac{17}{10^7} + \cdots$$

After the first term we have a geometric series with  $a = 17/10^3$  and  $r = 1/10^2$ . Therefore

$$\begin{aligned} 2.\overline{317} &= 2.3 + \frac{\frac{17}{10^3}}{1 - \frac{1}{10^2}} = 2.3 + \frac{\frac{17}{1000}}{\frac{99}{100}} \\ &= \frac{23}{10} + \frac{17}{990} = \frac{1147}{495} \end{aligned} \quad \blacksquare$$

**EXAMPLE 7** Find the sum of the series  $\sum_{n=0}^{\infty} x^n$ , where  $|x| < 1$ .

**SOLUTION** Notice that this series starts with  $n = 0$  and so the first term is  $x^0 = 1$ . (With series, we adopt the convention that  $x^0 = 1$  even when  $x = 0$ .) Thus

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + x^4 + \cdots$$

This is a geometric series with  $a = 1$  and  $r = x$ . Since  $|r| = |x| < 1$ , it converges and (4) gives

$$\boxed{5} \quad \sum_{n=0}^{\infty} x^n = \frac{1}{1-x} \quad \blacksquare$$

### ■ Test for Divergence

Recall that a series is divergent if its sequence of partial sums is a divergent sequence.

**EXAMPLE 8** Show that the harmonic series

$$\sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$$

is divergent.

**SOLUTION** For this particular series it's convenient to consider the partial sums  $s_2, s_4, s_8, s_{16}, s_{32}, \dots$  and show that they become large.

$$s_2 = 1 + \frac{1}{2}$$

$$s_4 = 1 + \frac{1}{2} + \left(\frac{1}{3} + \frac{1}{4}\right) > 1 + \frac{1}{2} + \left(\frac{1}{4} + \frac{1}{4}\right) = 1 + \frac{2}{2}$$

$$\begin{aligned} s_8 &= 1 + \frac{1}{2} + \left(\frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}\right) \\ &> 1 + \frac{1}{2} + \left(\frac{1}{4} + \frac{1}{4}\right) + \left(\frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8}\right) \\ &= 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 1 + \frac{3}{2} \end{aligned}$$

$$\begin{aligned} s_{16} &= 1 + \frac{1}{2} + \left(\frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \dots + \frac{1}{8}\right) + \left(\frac{1}{9} + \dots + \frac{1}{16}\right) \\ &> 1 + \frac{1}{2} + \left(\frac{1}{4} + \frac{1}{4}\right) + \left(\frac{1}{8} + \dots + \frac{1}{8}\right) + \left(\frac{1}{16} + \dots + \frac{1}{16}\right) \\ &= 1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} = 1 + \frac{4}{2} \end{aligned}$$

Similarly,  $s_{32} > 1 + \frac{5}{2}$ ,  $s_{64} > 1 + \frac{6}{2}$ , and in general

$$s_{2^n} > 1 + \frac{n}{2}$$

This shows that  $s_{2^n} \rightarrow \infty$  as  $n \rightarrow \infty$  and so  $\{s_n\}$  is divergent. Therefore the harmonic series diverges. ■

**6 Theorem** If the series  $\sum_{n=1}^{\infty} a_n$  is convergent, then  $\lim_{n \rightarrow \infty} a_n = 0$ .

**PROOF** Let  $s_n = a_1 + a_2 + \dots + a_n$ . Then  $a_n = s_n - s_{n-1}$ . Since  $\sum a_n$  is convergent, the sequence  $\{s_n\}$  is convergent. Let  $\lim_{n \rightarrow \infty} s_n = s$ . Since  $n - 1 \rightarrow \infty$  as  $n \rightarrow \infty$ , we also have  $\lim_{n \rightarrow \infty} s_{n-1} = s$ . Therefore

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (s_n - s_{n-1}) = \lim_{n \rightarrow \infty} s_n - \lim_{n \rightarrow \infty} s_{n-1} = s - s = 0$$

**NOTE** With any series  $\sum a_n$  we associate two sequences: the sequence  $\{s_n\}$  of its partial sums and the sequence  $\{a_n\}$  of its terms. If  $\sum a_n$  is convergent, then the limit of the sequence  $\{s_n\}$  is  $s$  (the sum of the series) and, as Theorem 6 asserts, the limit of the sequence  $\{a_n\}$  is 0.

**WARNING** The converse of Theorem 6 is not true in general. If  $\lim_{n \rightarrow \infty} a_n = 0$ , we cannot conclude that  $\sum a_n$  is convergent. Observe that for the harmonic series  $\sum 1/n$  we have  $a_n = 1/n \rightarrow 0$  as  $n \rightarrow \infty$ , but we showed in Example 8 that  $\sum 1/n$  is divergent.

**7 Test for Divergence** If  $\lim_{n \rightarrow \infty} a_n$  does not exist or if  $\lim_{n \rightarrow \infty} a_n \neq 0$ , then the series  $\sum_{n=1}^{\infty} a_n$  is divergent.

The Test for Divergence follows from Theorem 6 because, if the series is not divergent, then it is convergent, and so  $\lim_{n \rightarrow \infty} a_n = 0$ .

**EXAMPLE 9** Show that the series  $\sum_{n=1}^{\infty} \frac{n^2}{5n^2 + 4}$  diverges.

**SOLUTION**

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n^2}{5n^2 + 4} = \lim_{n \rightarrow \infty} \frac{1}{5 + 4/n^2} = \frac{1}{5} \neq 0$$

So the series diverges by the Test for Divergence. ■

**NOTE** If we find that  $\lim_{n \rightarrow \infty} a_n \neq 0$ , we know that  $\Sigma a_n$  is divergent. If we find that  $\lim_{n \rightarrow \infty} a_n = 0$ , this fact tells us *nothing* about the convergence or divergence of  $\Sigma a_n$ . Remember the warning given after Theorem 6: if  $\lim_{n \rightarrow \infty} a_n = 0$ , the series  $\Sigma a_n$  might converge or it might diverge.

### Properties of Convergent Series

The following properties of convergent series follow from the corresponding Limit Laws for Sequences in Section 11.1.

**8 Theorem** If  $\Sigma a_n$  and  $\Sigma b_n$  are convergent series, then so are the series  $\Sigma ca_n$  (where  $c$  is a constant),  $\Sigma(a_n + b_n)$ , and  $\Sigma(a_n - b_n)$ , and

$$(i) \quad \sum_{n=1}^{\infty} ca_n = c \sum_{n=1}^{\infty} a_n$$

$$(ii) \quad \sum_{n=1}^{\infty} (a_n + b_n) = \sum_{n=1}^{\infty} a_n + \sum_{n=1}^{\infty} b_n$$

$$(iii) \quad \sum_{n=1}^{\infty} (a_n - b_n) = \sum_{n=1}^{\infty} a_n - \sum_{n=1}^{\infty} b_n$$

We prove part (ii); the other parts are left as exercises.

**PROOF OF PART (ii)** Let

$$s_n = \sum_{i=1}^n a_i \quad s = \sum_{n=1}^{\infty} a_n \quad t_n = \sum_{i=1}^n b_i \quad t = \sum_{n=1}^{\infty} b_n$$

The  $n$ th partial sum for the series  $\Sigma(a_n + b_n)$  is

$$u_n = \sum_{i=1}^n (a_i + b_i)$$

and, using Equation 5.2.10, we have

$$\begin{aligned} \lim_{n \rightarrow \infty} u_n &= \lim_{n \rightarrow \infty} \sum_{i=1}^n (a_i + b_i) = \lim_{n \rightarrow \infty} \left( \sum_{i=1}^n a_i + \sum_{i=1}^n b_i \right) \\ &= \lim_{n \rightarrow \infty} \sum_{i=1}^n a_i + \lim_{n \rightarrow \infty} \sum_{i=1}^n b_i \\ &= \lim_{n \rightarrow \infty} s_n + \lim_{n \rightarrow \infty} t_n = s + t \end{aligned}$$

Therefore  $\sum (a_n + b_n)$  is convergent and its sum is

$$\sum_{n=1}^{\infty} (a_n + b_n) = s + t = \sum_{n=1}^{\infty} a_n + \sum_{n=1}^{\infty} b_n$$

**EXAMPLE 10** Find the sum of the series  $\sum_{n=1}^{\infty} \left( \frac{3}{n(n+1)} + \frac{1}{2^n} \right)$ .

**SOLUTION** The series  $\sum 1/2^n$  is a geometric series with  $a = \frac{1}{2}$  and  $r = \frac{1}{2}$ , so

$$\sum_{n=1}^{\infty} \frac{1}{2^n} = \frac{\frac{1}{2}}{1 - \frac{1}{2}} = 1$$

In Example 2 we found that

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = 1$$

So, by Theorem 8, the given series is convergent and

$$\begin{aligned} \sum_{n=1}^{\infty} \left( \frac{3}{n(n+1)} + \frac{1}{2^n} \right) &= 3 \sum_{n=1}^{\infty} \frac{1}{n(n+1)} + \sum_{n=1}^{\infty} \frac{1}{2^n} \\ &= 3 \cdot 1 + 1 = 4 \end{aligned}$$

**NOTE** A finite number of terms doesn't affect the convergence or divergence of a series. For instance, suppose that we were able to show that the series

$$\sum_{n=4}^{\infty} \frac{n}{n^3 + 1}$$

is convergent. Since

$$\sum_{n=1}^{\infty} \frac{n}{n^3 + 1} = \frac{1}{2} + \frac{2}{9} + \frac{3}{28} + \sum_{n=4}^{\infty} \frac{n}{n^3 + 1}$$

it follows that the entire series  $\sum_{n=1}^{\infty} n/(n^3 + 1)$  is convergent. Similarly, if it is known that the series  $\sum_{n=N+1}^{\infty} a_n$  converges, then the full series

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1}^N a_n + \sum_{n=N+1}^{\infty} a_n$$

is also convergent.

## 11.2 Exercises

1. (a) What is the difference between a sequence and a series?  
(b) What is a convergent series? What is a divergent series?
2. Explain what it means to say that  $\sum_{n=1}^{\infty} a_n = 5$ .

**3–4** Calculate the sum of the series  $\sum_{n=1}^{\infty} a_n$  whose partial sums are given.

3.  $s_n = 2 - 3(0.8)^n$

4.  $s_n = \frac{n^2 - 1}{4n^2 + 1}$

- 5–10 Calculate the first eight terms of the sequence of partial sums correct to four decimal places. Does it appear that the series is convergent or divergent?

5.  $\sum_{n=1}^{\infty} \frac{1}{n^3}$

6.  $\sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{n}}$

7.  $\sum_{n=1}^{\infty} \sin n$

8.  $\sum_{n=1}^{\infty} (-1)^n n$

9.  $\sum_{n=1}^{\infty} \frac{1}{n^4 + n^2}$

10.  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n!}$

11–14 Find at least 10 partial sums of the series. Graph both the sequence of terms and the sequence of partial sums on the same screen. Does it appear that the series is convergent or divergent? If it is convergent, find the sum. If it is divergent, explain why.

11.  $\sum_{n=1}^{\infty} \frac{6}{(-3)^n}$

12.  $\sum_{n=1}^{\infty} \cos n$

13.  $\sum_{n=1}^{\infty} \frac{n}{\sqrt{n^2 + 4}}$

14.  $\sum_{n=1}^{\infty} \frac{7^{n+1}}{10^n}$

15. Let  $a_n = \frac{2n}{3n + 1}$ .

- (a) Determine whether  $\{a_n\}$  is convergent.  
(b) Determine whether  $\sum_{n=1}^{\infty} a_n$  is convergent.

16. (a) Explain the difference between

$$\sum_{i=1}^n a_i \quad \text{and} \quad \sum_{j=1}^n a_j$$

- (b) Explain the difference between

$$\sum_{i=1}^n a_i \quad \text{and} \quad \sum_{i=1}^n a_j$$

17–22 Determine whether the series is convergent or divergent by expressing  $s_n$  as a telescoping sum (as in Example 2). If it is convergent, find its sum.

17.  $\sum_{n=1}^{\infty} \left( \frac{1}{n+2} - \frac{1}{n} \right)$

18.  $\sum_{n=4}^{\infty} \left( \frac{1}{\sqrt{n}} - \frac{1}{\sqrt{n+1}} \right)$

19.  $\sum_{n=1}^{\infty} \frac{3}{n(n+3)}$

20.  $\sum_{n=1}^{\infty} \ln \frac{n}{n+1}$

21.  $\sum_{n=1}^{\infty} (e^{1/n} - e^{1/(n+1)})$

22.  $\sum_{n=2}^{\infty} \frac{1}{n^3 - n}$

23–32 Determine whether the geometric series is convergent or divergent. If it is convergent, find its sum.

23.  $3 - 4 + \frac{16}{3} - \frac{64}{9} + \dots$

24.  $4 + 3 + \frac{9}{4} + \frac{27}{16} + \dots$

25.  $10 - 2 + 0.4 - 0.08 + \dots$

26.  $2 + 0.5 + 0.125 + 0.03125 + \dots$

27.  $\sum_{n=1}^{\infty} 12(0.73)^{n-1}$

28.  $\sum_{n=1}^{\infty} \frac{5}{\pi^n}$

29.  $\sum_{n=1}^{\infty} \frac{(-3)^{n-1}}{4^n}$

30.  $\sum_{n=0}^{\infty} \frac{3^{n+1}}{(-2)^n}$

31.  $\sum_{n=1}^{\infty} \frac{e^{2n}}{6^{n-1}}$

32.  $\sum_{n=1}^{\infty} \frac{6 \cdot 2^{2n-1}}{3^n}$

33–50 Determine whether the series is convergent or divergent. If it is convergent, find its sum.

33.  $\frac{1}{3} + \frac{1}{6} + \frac{1}{9} + \frac{1}{12} + \frac{1}{15} + \dots$

34.  $\frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \frac{4}{5} + \frac{5}{6} + \frac{6}{7} + \dots$

35.  $\frac{2}{5} + \frac{4}{25} + \frac{8}{125} + \frac{16}{625} + \frac{32}{3125} + \dots$

36.  $\frac{1}{3} + \frac{2}{9} + \frac{1}{27} + \frac{2}{81} + \frac{1}{243} + \frac{2}{729} + \dots$

37.  $\sum_{n=1}^{\infty} \frac{2+n}{1-2n}$

38.  $\sum_{k=1}^{\infty} \frac{k^2}{k^2 - 2k + 5}$

39.  $\sum_{n=1}^{\infty} 3^{n+1} 4^{-n}$

40.  $\sum_{n=1}^{\infty} [(-0.2)^n + (0.6)^{n-1}]$

41.  $\sum_{n=1}^{\infty} \frac{1}{4 + e^{-n}}$

42.  $\sum_{n=1}^{\infty} \frac{2^n + 4^n}{e^n}$

43.  $\sum_{k=1}^{\infty} (\sin 100)^k$

44.  $\sum_{n=1}^{\infty} \frac{1}{1 + \left(\frac{2}{3}\right)^n}$

45.  $\sum_{n=1}^{\infty} \ln \left( \frac{n^2 + 1}{2n^2 + 1} \right)$

46.  $\sum_{k=0}^{\infty} (\sqrt{2})^{-k}$

47.  $\sum_{n=1}^{\infty} \arctan n$

48.  $\sum_{n=1}^{\infty} \left( \frac{3}{5^n} + \frac{2}{n} \right)$

49.  $\sum_{n=1}^{\infty} \left( \frac{1}{e^n} + \frac{1}{n(n+1)} \right)$

50.  $\sum_{n=1}^{\infty} \frac{e^n}{n^2}$

51. Let  $x = 0.99999 \dots$

- (a) Do you think that  $x < 1$  or  $x = 1$ ?  
(b) Sum a geometric series to find the value of  $x$ .  
(c) How many decimal representations does the number 1 have?  
(d) Which numbers have more than one decimal representation?

52. A sequence of terms is defined by

$$a_1 = 1 \quad a_n = (5 - n)a_{n-1}$$

Calculate  $\sum_{n=1}^{\infty} a_n$ .

53–58 Express the number as a ratio of integers.

53.  $0.\overline{8} = 0.8888 \dots$

54.  $0.\overline{46} = 0.46464646 \dots$

55.  $2.\overline{516} = 2.516516516 \dots$

56.  $10.\overline{135} = 10.13535353 \dots$

57.  $1.234\overline{567}$

58.  $5.\overline{71358}$

**59–66** Find the values of  $x$  for which the series converges. Find the sum of the series for those values of  $x$ .

59.  $\sum_{n=1}^{\infty} (-5)^n x^n$

60.  $\sum_{n=1}^{\infty} (x + 2)^n$

61.  $\sum_{n=0}^{\infty} \frac{(x - 2)^n}{3^n}$

62.  $\sum_{n=0}^{\infty} (-4)^n (x - 5)^n$

63.  $\sum_{n=0}^{\infty} \frac{2^n}{x^n}$

64.  $\sum_{n=0}^{\infty} \frac{x^n}{2^n}$

65.  $\sum_{n=0}^{\infty} e^{nx}$

66.  $\sum_{n=0}^{\infty} \frac{\sin^n x}{3^n}$

**T 67–68** Use the partial fraction command on a computer algebra system to find a convenient expression for the partial sum, and then use this expression to find the sum of the series. Check your answer by using the CAS to sum the series directly.

67.  $\sum_{n=1}^{\infty} \frac{3n^2 + 3n + 1}{(n^2 + n)^3}$

68.  $\sum_{n=3}^{\infty} \frac{1}{n^5 - 5n^3 + 4n}$

69. If the  $n$ th partial sum of a series  $\sum_{n=1}^{\infty} a_n$  is

$$s_n = \frac{n - 1}{n + 1}$$

find  $a_n$  and  $\sum_{n=1}^{\infty} a_n$ .

70. If the  $n$ th partial sum of a series  $\sum_{n=1}^{\infty} a_n$  is  $s_n = 3 - n2^{-n}$ , find  $a_n$  and  $\sum_{n=1}^{\infty} a_n$ .

71. A doctor prescribes a 100-mg antibiotic tablet to be taken every eight hours. It is known that the body eliminates 75% of the drug in eight hours.

- (a) How much of the drug is in the body just after the second tablet is taken? After the third tablet?
- (b) If  $Q_n$  is the quantity of the antibiotic in the body just after the  $n$ th tablet is taken, find an equation that expresses  $Q_{n+1}$  in terms of  $Q_n$ .
- (c) What quantity of the antibiotic remains in the body in the long run?

72. A patient is injected with a drug every 12 hours. Immediately before each injection the concentration of the drug has been reduced by 90% and the new dose increases the concentration by 1.5 mg/L.

- (a) What is the concentration after three doses?
- (b) If  $C_n$  is the concentration after the  $n$ th dose, find a formula for  $C_n$  as a function of  $n$ .
- (c) What is the limiting value of the concentration?

73. A patient takes 150 mg of a drug at the same time every day. It is known that the body eliminates 95% of the drug in 24 hours.

- (a) What quantity of the drug is in the body after the third tablet? After the  $n$ th tablet?
- (b) What quantity of the drug remains in the body in the long run?

74. After injection of a dose  $D$  of insulin, the concentration of insulin in a patient's system decays exponentially and so it can be written as  $D e^{-at}$ , where  $t$  represents time in hours and  $a$  is a positive constant.

- (a) If a dose  $D$  is injected every  $T$  hours, write an expression for the sum of the residual concentrations just before the  $(n + 1)$ st injection.
- (b) Determine the limiting pre-injection concentration.
- (c) If the concentration of insulin must always remain at or above a critical value  $C$ , determine a minimal dosage  $D$  in terms of  $C$ ,  $a$ , and  $T$ .

75. When money is spent on goods and services, those who receive the money also spend some of it. The people receiving some of the twice-spent money will spend some of that, and so on. Economists call this chain reaction the *multiplier effect*. In a hypothetical isolated community, the local government begins the process by spending  $D$  dollars. Suppose that each recipient of spent money spends  $100c\%$  and saves  $100s\%$  of the money that he or she receives. The values  $c$  and  $s$  are called the *marginal propensity to consume* and the *marginal propensity to save* and, of course,  $c + s = 1$ .

- (a) Let  $S_n$  be the total spending that has been generated after  $n$  transactions. Find an equation for  $S_n$ .
- (b) Show that  $\lim_{n \rightarrow \infty} S_n = kD$ , where  $k = 1/s$ . The number  $k$  is called the *multiplier*. What is the multiplier if the marginal propensity to consume is 80%?

*Note:* The federal government uses this principle to justify deficit spending. Banks use this principle to justify lending a large percentage of the money that they receive in deposits.

76. A certain ball has the property that each time it falls from a height  $h$  onto a hard, level surface, it rebounds to a height  $rh$ , where  $0 < r < 1$ . Suppose that the ball is dropped from an initial height of  $H$  meters.

- (a) Assuming that the ball continues to bounce indefinitely, find the total distance that it travels.
- (b) Calculate the total time that the ball travels. (Use the fact that the ball falls  $\frac{1}{2}gt^2$  meters in  $t$  seconds.)
- (c) Suppose that each time the ball strikes the surface with velocity  $v$  it rebounds with velocity  $-kv$ , where  $0 < k < 1$ . How long will it take for the ball to come to rest?

77. Find the value of  $c$  if  $\sum_{n=2}^{\infty} (1 + c)^{-n} = 2$ .

78. Find the value of  $c$  such that  $\sum_{n=0}^{\infty} e^{nc} = 10$ .

**79–81 The Harmonic Series Diverges** In Example 8 we proved that the harmonic series diverges. Here we outline additional methods of proving this fact. In each case, assume that the series converges with sum  $S$ , and show that this assumption leads to a contradiction.

$$\begin{aligned} 79. \quad S &= \left(1 + \frac{1}{2}\right) + \left(\frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \frac{1}{6}\right) + \dots \\ &> \left(\frac{1}{2} + \frac{1}{2}\right) + \left(\frac{1}{4} + \frac{1}{4}\right) + \left(\frac{1}{6} + \frac{1}{6}\right) + \dots = S \\ 80. \quad S &= 1 + \left(\frac{1}{2} + \frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \frac{1}{6} + \frac{1}{7}\right) + \\ &\quad \left(\frac{1}{8} + \frac{1}{9} + \frac{1}{10}\right) + \dots > 1 + \frac{3}{3} + \frac{3}{6} + \frac{3}{9} + \dots = 1 + S \end{aligned}$$

*Hint:* First show that  $\frac{1}{n-1} + \frac{1}{n+1} > \frac{2}{n}$ .

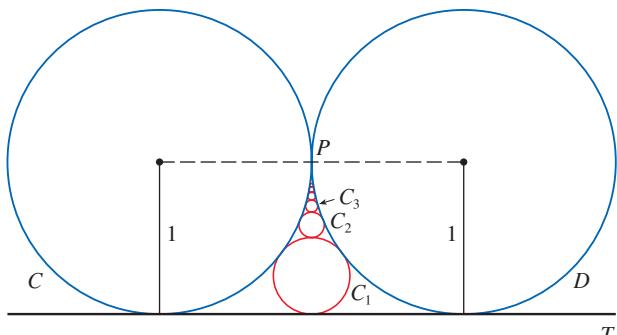

$$\begin{aligned} 81. \quad e^{1+(1/2)+(1/3)+\dots+(1/n)} &= e^1 \cdot e^{1/2} \cdot e^{1/3} \cdots e^{1/n} \\ &> \left(1 + 1\right)\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right) \cdots \left(1 + \frac{1}{n}\right) = n + 1 \end{aligned}$$

*Hint:* First show that  $e^x > 1 + x$ .

- 82.** Graph the curves  $y = x^n$ ,  $0 \leq x \leq 1$ , for  $n = 0, 1, 2, 3, 4, \dots$  on a common screen. By finding the areas between successive curves, give a geometric demonstration of the fact, shown in Example 2, that

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = 1$$

- 83.** The figure shows two circles  $C$  and  $D$  of radius 1 that touch at  $P$ . The line  $T$  is a common tangent line;  $C_1$  is the circle that touches  $C$ ,  $D$ , and  $T$ ;  $C_2$  is the circle that touches  $C$ ,  $D$ , and  $C_1$ ;  $C_3$  is the circle that touches  $C$ ,  $D$ , and  $C_2$ . This procedure can be continued indefinitely and produces an infinite sequence of circles  $\{C_n\}$ . Find an expression for the diameter of  $C_n$  and thus provide another geometric demonstration of Example 2.

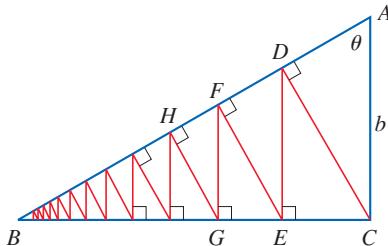

- 84.** A right triangle  $ABC$  is given with  $\angle A = \theta$  and  $|AC| = b$ .  $CD$  is drawn perpendicular to  $AB$ ,  $DE$  is drawn perpendicular

to  $BC$ ,  $EF \perp AB$ , and this process is continued indefinitely, as shown in the figure. Find the total length of all the perpendiculars

$$|CD| + |DE| + |EF| + |FG| + \dots$$

in terms of  $b$  and  $\theta$ .

- 85.** What is wrong with the following calculation?

$$\begin{aligned} 0 &= 0 + 0 + 0 + \dots \\ &= (1 - 1) + (1 - 1) + (1 - 1) + \dots \\ &= 1 - 1 + 1 - 1 + 1 - 1 + \dots \\ &= 1 + (-1 + 1) + (-1 + 1) + (-1 + 1) + \dots \\ &= 1 + 0 + 0 + 0 + \dots = 1 \end{aligned}$$

(Guido Ubaldus thought that this proved the existence of God because “something has been created out of nothing.”)

- 86.** Suppose that  $\sum_{n=1}^{\infty} a_n$  ( $a_n \neq 0$ ) is known to be a convergent series. Prove that  $\sum_{n=1}^{\infty} 1/a_n$  is a divergent series.

- 87.** (a) Prove part (i) of Theorem 8.  
(b) Prove part (iii) of Theorem 8.
- 88.** If  $\sum a_n$  is divergent and  $c \neq 0$ , show that  $\sum ca_n$  is divergent.
- 89.** If  $\sum a_n$  is convergent and  $\sum b_n$  is divergent, show that the series  $\sum (a_n + b_n)$  is divergent. [Hint: Argue by contradiction.]
- 90.** If  $\sum a_n$  and  $\sum b_n$  are both divergent, is  $\sum (a_n + b_n)$  necessarily divergent?
- 91.** Suppose that a series  $\sum a_n$  has positive terms and its partial sums  $s_n$  satisfy the inequality  $s_n \leq 1000$  for all  $n$ . Explain why  $\sum a_n$  must be convergent.
- 92.** The Fibonacci sequence was defined in Section 11.1 by the equations

$$f_1 = 1, \quad f_2 = 1, \quad f_n = f_{n-1} + f_{n-2} \quad n \geq 3$$

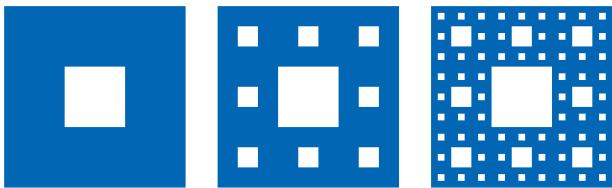

Show that each of the following statements is true.

- (a)  $\frac{1}{f_{n-1}f_{n+1}} = \frac{1}{f_{n-1}f_n} - \frac{1}{f_nf_{n+1}}$
- (b)  $\sum_{n=2}^{\infty} \frac{1}{f_{n-1}f_{n+1}} = 1$
- (c)  $\sum_{n=2}^{\infty} \frac{f_n}{f_{n-1}f_{n+1}} = 2$

- 93.** The **Cantor set**, named after the German mathematician Georg Cantor (1845–1918), is constructed as follows. We

start with the closed interval  $[0, 1]$  and remove the open interval  $(\frac{1}{3}, \frac{2}{3})$ . That leaves the two intervals  $[0, \frac{1}{3}]$  and  $[\frac{2}{3}, 1]$  and we remove the open middle third of each. Four intervals remain and again we remove the open middle third of each of them. We continue this procedure indefinitely, at each step removing the open middle third of every interval that remains from the preceding step. The Cantor set consists of the numbers that remain in  $[0, 1]$  after all those intervals have been removed.

- (a) Show that the total length of all the intervals that are removed is 1. Despite that, the Cantor set contains infinitely many numbers. Give examples of some numbers in the Cantor set.
- (b) The **Sierpinski carpet** is a two-dimensional counterpart of the Cantor set. It is constructed by removing the center one-ninth of a square of side 1, then removing the centers of the eight smaller remaining squares, and so on. (The figure shows the first three steps of the construction.) Show that the sum of the areas of the removed squares is 1. This implies that the Sierpinski carpet has area 0.

94. (a) A sequence  $\{a_n\}$  is defined recursively by the equation  $a_n = \frac{1}{2}(a_{n-1} + a_{n-2})$  for  $n \geq 3$ , where  $a_1$  and  $a_2$  can be any real numbers. Experiment with various values of  $a_1$

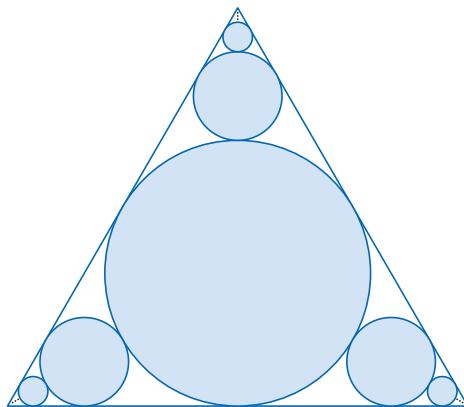

and  $a_2$  and use a calculator to guess the limit of the sequence.

- (b) Find  $\lim_{n \rightarrow \infty} a_n$  in terms of  $a_1$  and  $a_2$  by expressing  $a_{n+1} - a_n$  in terms of  $a_2 - a_1$  and summing a series.

95. Consider the series  $\sum_{n=1}^{\infty} n/(n+1)!$ .

- (a) Find the partial sums  $s_1, s_2, s_3$ , and  $s_4$ . Do you recognize the denominators? Use the pattern to guess a formula for  $s_n$ .
- (b) Use mathematical induction to prove your guess.
- (c) Show that the given infinite series is convergent, and find its sum.

96. The figure shows infinitely many circles approaching the vertices of an equilateral triangle, each circle touching other circles and sides of the triangle. If the triangle has sides of length 1, find the total area occupied by the circles.

## 11.3 | The Integral Test and Estimates of Sums

In general, it is difficult to find the exact sum of a series. We were able to accomplish this for geometric series and for some telescoping series because in each of those cases we could find a simple formula for the  $n$ th partial sum  $s_n$ . But usually it isn't easy to discover such a formula. Therefore, in the next few sections, we develop several tests that enable us to determine whether a series is convergent or divergent without explicitly finding its sum. (In some cases, however, our methods will enable us to find good estimates of the sum.) Our first test involves improper integrals.

### The Integral Test

We begin by investigating the series whose terms are the reciprocals of the squares of the positive integers:

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \frac{1}{5^2} + \dots$$

There's no simple formula for the sum  $s_n$  of the first  $n$  terms, but the computer-generated

$n$	$s_n = \sum_{i=1}^n \frac{1}{i^2}$
5	1.4636
10	1.5498
50	1.6251
100	1.6350
500	1.6429
1000	1.6439
5000	1.6447

table of approximate values given in the margin suggests that the partial sums are approaching a number near 1.64 as  $n \rightarrow \infty$  and so it looks as if the series is convergent.

We can confirm this impression with a geometric argument. Figure 1 shows the curve  $y = 1/x^2$  and rectangles that lie below the curve. The base of each rectangle is an interval of length 1; the height is equal to the value of the function  $y = 1/x^2$  at the right endpoint of the interval.

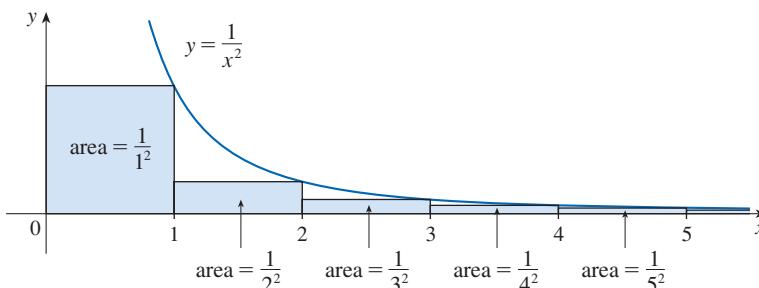

FIGURE 1

So the sum of the areas of the rectangles is

$$\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \frac{1}{5^2} + \dots = \sum_{n=1}^{\infty} \frac{1}{n^2}$$

If we exclude the first rectangle, the total area of the remaining rectangles is smaller than the area under the curve  $y = 1/x^2$  for  $x \geq 1$ , which is the value of the integral  $\int_1^{\infty} (1/x^2) dx$ . In Section 7.8 we discovered that this improper integral is convergent and has value 1. So the picture shows that all the partial sums are less than

$$\frac{1}{1^2} + \int_1^{\infty} \frac{1}{x^2} dx = 2$$

Thus the partial sums are bounded. We also know that the partial sums are increasing (because all the terms are positive). Therefore the partial sums converge (by the Monotonic Sequence Theorem) and so the series is convergent. The sum of the series (the limit of the partial sums) is also less than 2:

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots < 2$$

$n$	$s_n = \sum_{i=1}^n \frac{1}{\sqrt{i}}$
5	3.2317
10	5.0210
50	12.7524
100	18.5896
500	43.2834
1000	61.8010
5000	139.9681

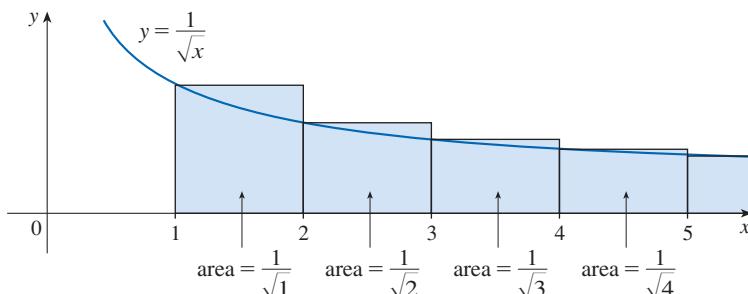

[The exact sum of this series was found by the Swiss mathematician Leonhard Euler (1707–1783) to be  $\pi^2/6$ , but the proof of this fact is quite difficult. (See Problem 6 in the Problems Plus following Chapter 15.)]

Now let's look at the series

$$\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}} = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \frac{1}{\sqrt{5}} + \dots$$

The table of values of  $s_n$  suggests that the partial sums aren't approaching a finite number, so we suspect that the given series may be divergent. Again we use a picture for

confirmation. Figure 2 shows the curve  $y = 1/\sqrt{x}$ , but this time we use rectangles whose tops lie *above* the curve.

**FIGURE 2**

The base of each rectangle is an interval of length 1. The height is equal to the value of the function  $y = 1/\sqrt{x}$  at the *left* endpoint of the interval. So the sum of the areas of all the rectangles is

$$\frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \frac{1}{\sqrt{5}} + \dots = \sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$$

This total area is greater than the area under the curve  $y = 1/\sqrt{x}$  for  $x \geq 1$ , which is equal to the integral  $\int_1^{\infty} (1/\sqrt{x}) dx$ . But we know from Example 7.8.4 that this improper integral is divergent. In other words, the area under the curve is infinite. So the sum of the series must be infinite; that is, the series is divergent.

The same sort of geometric reasoning that we used for these two series can be used to prove the following test. (The proof is given at the end of this section.)

**The Integral Test** Suppose  $f$  is a continuous, positive, decreasing function on  $[1, \infty)$  and let  $a_n = f(n)$ . Then the series  $\sum_{n=1}^{\infty} a_n$  is convergent if and only if the improper integral  $\int_1^{\infty} f(x) dx$  is convergent. In other words:

- (i) If  $\int_1^{\infty} f(x) dx$  is convergent, then  $\sum_{n=1}^{\infty} a_n$  is convergent.
- (ii) If  $\int_1^{\infty} f(x) dx$  is divergent, then  $\sum_{n=1}^{\infty} a_n$  is divergent.

**NOTE** When we use the Integral Test, it is not necessary to start the series or the integral at  $n = 1$ . For instance, in testing the series

$$\sum_{n=4}^{\infty} \frac{1}{(n-3)^2} \quad \text{we use} \quad \int_4^{\infty} \frac{1}{(x-3)^2} dx$$

Also, it is not necessary that  $f$  be *always* decreasing. What is important is that  $f$  be *ultimately* decreasing, that is, decreasing for  $x$  larger than some number  $N$ . Then  $\sum_{n=N}^{\infty} a_n$  is convergent, so  $\sum_{n=1}^{\infty} a_n$  is convergent (see the note at the end of Section 11.2).

In order to use the Integral Test we need to be able to evaluate  $\int_1^\infty f(x) dx$  and therefore we have to be able to find an antiderivative of  $f$ . Frequently this is difficult or impossible, so in the next three sections we develop other tests for convergence.

**EXAMPLE 1** Test the series  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 1}$  for convergence or divergence.

**SOLUTION** The function  $f(x) = 1/(x^2 + 1)$  is continuous, positive, and decreasing on  $[1, \infty)$  so we use the Integral Test:

$$\begin{aligned}\int_1^\infty \frac{1}{x^2 + 1} dx &= \lim_{t \rightarrow \infty} \int_1^t \frac{1}{x^2 + 1} dx = \lim_{t \rightarrow \infty} \tan^{-1} x \Big|_1^t \\ &= \lim_{t \rightarrow \infty} \left( \tan^{-1} t - \frac{\pi}{4} \right) = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}\end{aligned}$$

Thus  $\int_1^\infty 1/(x^2 + 1) dx$  is a convergent integral and so, by the Integral Test, the series  $\sum 1/(n^2 + 1)$  is convergent. ■

**EXAMPLE 2** For what values of  $p$  is the series  $\sum_{n=1}^{\infty} \frac{1}{n^p}$  convergent?

**SOLUTION** If  $p < 0$ , then  $\lim_{n \rightarrow \infty} (1/n^p) = \infty$ . If  $p = 0$ , then  $\lim_{n \rightarrow \infty} (1/n^p) = 1$ . In either case  $\lim_{n \rightarrow \infty} (1/n^p) \neq 0$ , so the given series diverges by the Test for Divergence (11.2.7).

If  $p > 0$ , then the function  $f(x) = 1/x^p$  is clearly continuous, positive, and decreasing on  $[1, \infty)$ . We found in Section 7.8 [see (7.8.2)] that

$$\int_1^\infty \frac{1}{x^p} dx \text{ converges if } p > 1 \text{ and diverges if } p \leq 1$$

It follows from the Integral Test that the series  $\sum 1/n^p$  converges if  $p > 1$  and diverges if  $0 < p \leq 1$ . (For  $p = 1$ , this series is the harmonic series discussed in Example 11.2.8.) ■

The series in Example 2 is called the ***p*-series**. It is important in the rest of this chapter, so we summarize the results of Example 2 for future reference as follows.

**1** The *p*-series  $\sum_{n=1}^{\infty} \frac{1}{n^p}$  is convergent if  $p > 1$  and divergent if  $p \leq 1$ .

### EXAMPLE 3

(a) The series

$$\sum_{n=1}^{\infty} \frac{1}{n^3} = \frac{1}{1^3} + \frac{1}{2^3} + \frac{1}{3^3} + \frac{1}{4^3} + \dots$$

is convergent because it is a *p*-series with  $p = 3 > 1$ .

(b) The series

$$\sum_{n=1}^{\infty} \frac{1}{n^{1/3}} = \sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{n}} = 1 + \frac{1}{\sqrt[3]{2}} + \frac{1}{\sqrt[3]{3}} + \frac{1}{\sqrt[3]{4}} + \dots$$

is divergent because it is a *p*-series with  $p = \frac{1}{3} < 1$ . ■

We can think of the convergence of a series of positive terms as depending on how “rapidly” the terms of the series approach zero. For any *p*-series (with  $p > 0$ ) the terms  $a_n = 1/n^p$  tend toward zero, but they do so more rapidly for larger values of  $p$ .

 **NOTE** We should *not* infer from the Integral Test that the sum of the series is equal to the value of the integral. In fact,

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6} \quad \text{whereas} \quad \int_1^{\infty} \frac{1}{x^2} dx = 1$$

Therefore, in general,

$$\sum_{n=1}^{\infty} a_n \neq \int_1^{\infty} f(x) dx$$

**EXAMPLE 4** Determine whether the series  $\sum_{n=1}^{\infty} \frac{\ln n}{n}$  converges or diverges.

**SOLUTION** The function  $f(x) = (\ln x)/x$  is positive and continuous for  $x > 1$  because the logarithm function is continuous. But it is not obvious whether or not  $f$  is decreasing, so we compute its derivative:

$$f'(x) = \frac{(1/x)x - \ln x}{x^2} = \frac{1 - \ln x}{x^2}$$

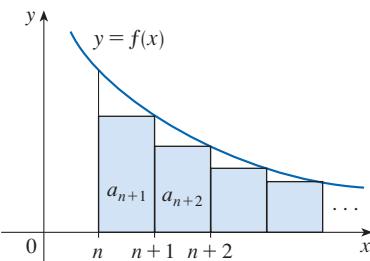

Thus  $f'(x) < 0$  when  $\ln x > 1$ , that is, when  $x > e$ . It follows that  $f$  is decreasing when  $x > e$  and so we can apply the Integral Test:

$$\begin{aligned} \int_1^{\infty} \frac{\ln x}{x} dx &= \lim_{t \rightarrow \infty} \int_1^t \frac{\ln x}{x} dx = \lim_{t \rightarrow \infty} \frac{(\ln x)^2}{2} \Big|_1^t \\ &= \lim_{t \rightarrow \infty} \frac{(\ln t)^2}{2} = \infty \end{aligned}$$

Since this improper integral is divergent, the series  $\sum (\ln n)/n$  is also divergent by the Integral Test. ■

### ■ Estimating the Sum of a Series

Suppose we have been able to use the Integral Test to show that a series  $\sum a_n$  is convergent and we now want to find an approximation to the sum  $s$  of the series. Of course, any partial sum  $s_n$  is an approximation to  $s$  because  $\lim_{n \rightarrow \infty} s_n = s$ . But how good is such an approximation? To find out, we need to estimate the size of the **remainder**

$$R_n = s - s_n = a_{n+1} + a_{n+2} + a_{n+3} + \dots$$

The remainder  $R_n$  is the error made when  $s_n$ , the sum of the first  $n$  terms, is used as an approximation to the total sum.

We use the same notation and ideas as in the Integral Test, assuming that  $f$  is decreasing on  $[n, \infty)$ . Comparing the areas of the rectangles with the area under  $y = f(x)$  for  $x \geq n$  in Figure 3, we see that

$$R_n = a_{n+1} + a_{n+2} + \dots \leq \int_n^{\infty} f(x) dx$$

**FIGURE 3**

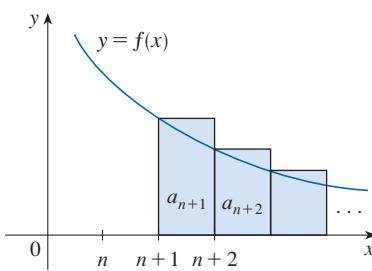

FIGURE 4

Similarly, we see from Figure 4 that

$$R_n = a_{n+1} + a_{n+2} + \dots \geq \int_{n+1}^{\infty} f(x) dx$$

So we have proved the following error estimate.

**2 Remainder Estimate for the Integral Test** Suppose  $f(k) = a_k$ , where  $f$  is a continuous, positive, decreasing function for  $x \geq n$  and  $\sum a_n$  is convergent. If  $R_n = s - s_n$ , then

$$\int_{n+1}^{\infty} f(x) dx \leq R_n \leq \int_n^{\infty} f(x) dx$$

### EXAMPLE 5

- (a) Approximate the sum of the series  $\sum 1/n^3$  by using the sum of the first 10 terms. Estimate the error involved in this approximation.  
 (b) How many terms are required to ensure that the sum is accurate to within 0.0005?

**SOLUTION** In both parts (a) and (b) we need to know  $\int_n^{\infty} f(x) dx$ . With  $f(x) = 1/x^3$ , which satisfies the conditions of the Integral Test, we have

$$\int_n^{\infty} \frac{1}{x^3} dx = \lim_{t \rightarrow \infty} \left[ -\frac{1}{2x^2} \right]_n^t = \lim_{t \rightarrow \infty} \left( -\frac{1}{2t^2} + \frac{1}{2n^2} \right) = \frac{1}{2n^2}$$

- (a) Approximating the sum of the series by the 10th partial sum, we have

$$\sum_{n=1}^{\infty} \frac{1}{n^3} \approx s_{10} = \frac{1}{1^3} + \frac{1}{2^3} + \frac{1}{3^3} + \dots + \frac{1}{10^3} \approx 1.1975$$

According to the remainder estimate in (2), we have

$$R_{10} \leq \int_{10}^{\infty} \frac{1}{x^3} dx = \frac{1}{2(10)^2} = \frac{1}{200}$$

So the size of the error is at most 0.005.

- (b) Accuracy to within 0.0005 means that we have to find a value of  $n$  such that  $R_n \leq 0.0005$ . Since

$$R_n \leq \int_n^{\infty} \frac{1}{x^3} dx = \frac{1}{2n^2}$$

we want

$$\frac{1}{2n^2} < 0.0005$$

Solving this inequality, we get

$$n^2 > \frac{1}{0.001} = 1000 \quad \text{or} \quad n > \sqrt{1000} \approx 31.6$$

We need 32 terms to ensure accuracy to within 0.0005. ■

If we add  $s_n$  to each side of the inequalities in (2), we get

$$\boxed{3} \quad s_n + \int_{n+1}^{\infty} f(x) dx \leq s \leq s_n + \int_n^{\infty} f(x) dx$$

because  $s_n + R_n = s$ . The inequalities in (3) give a lower bound and an upper bound for  $s$ . They provide a more accurate approximation to the sum of the series than the partial sum  $s_n$  does.

Although Euler was able to calculate the exact sum of the  $p$ -series for  $p = 2$ , nobody has been able to find the exact sum for  $p = 3$ . In Example 6, however, we show how to estimate this sum.

**EXAMPLE 6** Use (3) with  $n = 10$  to estimate the sum of the series  $\sum_{n=1}^{\infty} \frac{1}{n^3}$ .

**SOLUTION** The inequalities in (3) become

$$s_{10} + \int_{11}^{\infty} \frac{1}{x^3} dx \leq s \leq s_{10} + \int_{10}^{\infty} \frac{1}{x^3} dx$$

From Example 5 we know that

$$\int_n^{\infty} \frac{1}{x^3} dx = \frac{1}{2n^2}$$

so  $s_{10} + \frac{1}{2(11)^2} \leq s \leq s_{10} + \frac{1}{2(10)^2}$

Using  $s_{10} \approx 1.197532$ , we get

$$1.201664 \leq s \leq 1.202532$$

If we approximate  $s$  by the midpoint of this interval, then the error is at most half the length of the interval. So

$$\sum_{n=1}^{\infty} \frac{1}{n^3} \approx 1.2021 \quad \text{with error} < 0.0005$$

If we compare Example 6 with Example 5, we see that the improved estimate in (3) can be much better than the estimate  $s \approx s_n$ . To make the error smaller than 0.0005 we had to use 32 terms in Example 5 but only 10 terms in Example 6.

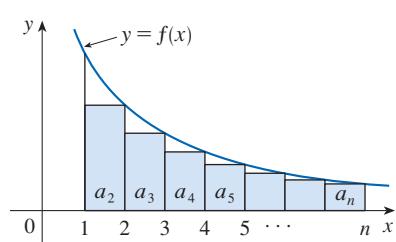

FIGURE 5

### ■ Proof of the Integral Test

We have already seen the basic idea behind the proof of the Integral Test in Figures 1 and 2 for the series  $\sum 1/n^2$  and  $\sum 1/\sqrt{n}$ . For the general series  $\sum a_n$ , look at Figures 5 and 6. The area of the first shaded rectangle in Figure 5 is the value of  $f$  at the right endpoint of  $[1, 2]$ , that is,  $f(2) = a_2$ . So, comparing the areas of the shaded rectangles with the area under  $y = f(x)$  from 1 to  $n$ , we see that

$$\boxed{4} \quad a_2 + a_3 + \dots + a_n \leq \int_1^n f(x) dx$$

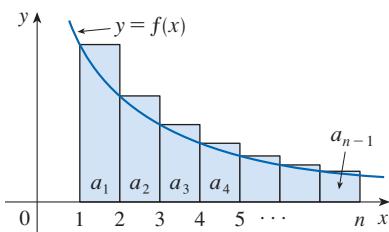

FIGURE 6

(Notice that this inequality depends on the fact that  $f$  is decreasing.) Likewise, Figure 6 shows that

5

$$\int_1^n f(x) dx \leq a_1 + a_2 + \cdots + a_{n-1}$$

(i) If  $\int_1^\infty f(x) dx$  is convergent, then (4) gives

$$\sum_{i=2}^n a_i \leq \int_1^n f(x) dx \leq \int_1^\infty f(x) dx$$

since  $f(x) \geq 0$ . Therefore

$$s_n = a_1 + \sum_{i=2}^n a_i \leq a_1 + \int_1^\infty f(x) dx = M, \text{ say}$$

Since  $s_n \leq M$  for all  $n$ , the sequence  $\{s_n\}$  is bounded above. Also

$$s_{n+1} = s_n + a_{n+1} \geq s_n$$

since  $a_{n+1} = f(n+1) \geq 0$ . Thus  $\{s_n\}$  is an increasing bounded sequence and so it is convergent by the Monotonic Sequence Theorem (11.1.12). This means that  $\sum a_n$  is convergent.

(ii) If  $\int_1^\infty f(x) dx$  is divergent, then  $\int_1^n f(x) dx \rightarrow \infty$  as  $n \rightarrow \infty$  because  $f(x) \geq 0$ . But (5) gives

$$\int_1^n f(x) dx \leq \sum_{i=1}^{n-1} a_i = s_{n-1}$$

and so  $s_{n-1} \rightarrow \infty$ . This implies that  $s_n \rightarrow \infty$  and so  $\sum a_n$  diverges. ■

### 11.3 Exercises

1. Draw a picture to show that

$$\sum_{n=2}^{\infty} \frac{1}{n^{1.5}} < \int_1^{\infty} \frac{1}{x^{1.5}} dx$$

What can you conclude about the series?

2. Suppose  $f$  is a continuous positive decreasing function for  $x \geq 1$  and  $a_n = f(n)$ . By drawing a picture, rank the following three quantities in increasing order:

$$\int_1^6 f(x) dx \quad \sum_{i=1}^5 a_i \quad \sum_{i=2}^6 a_i$$

- 3–10** Use the Integral Test to determine whether the series is convergent or divergent.

3.  $\sum_{n=1}^{\infty} n^{-3}$

4.  $\sum_{n=1}^{\infty} n^{-0.3}$

5.  $\sum_{n=1}^{\infty} \frac{2}{5n-1}$

6.  $\sum_{n=1}^{\infty} \frac{1}{(3n-1)^4}$

7.  $\sum_{n=2}^{\infty} \frac{n^2}{n^3 + 1}$

8.  $\sum_{n=1}^{\infty} n^2 e^{-n^3}$

9.  $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^3}$

10.  $\sum_{n=1}^{\infty} \frac{\tan^{-1} n}{1+n^2}$

- 11–28** Determine whether the series is convergent or divergent.

11.  $\sum_{n=1}^{\infty} \frac{1}{n^{\sqrt{2}}}$

12.  $\sum_{n=3}^{\infty} n^{-0.9999}$

13.  $1 + \frac{1}{8} + \frac{1}{27} + \frac{1}{64} + \frac{1}{125} + \cdots$

14.  $\frac{1}{5} + \frac{1}{7} + \frac{1}{9} + \frac{1}{11} + \frac{1}{13} + \cdots$

15.  $\frac{1}{3} + \frac{1}{7} + \frac{1}{11} + \frac{1}{15} + \frac{1}{19} + \cdots$

16.  $1 + \frac{1}{2\sqrt{2}} + \frac{1}{3\sqrt{3}} + \frac{1}{4\sqrt{4}} + \frac{1}{5\sqrt{5}} + \cdots$

17.  $\sum_{n=1}^{\infty} \frac{\sqrt{n} + 4}{n^2}$

18.  $\sum_{n=1}^{\infty} \frac{\sqrt{n}}{1 + n^{3/2}}$

19.  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 4}$

20.  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 2n + 2}$

21.  $\sum_{n=1}^{\infty} \frac{n^3}{n^4 + 4}$

22.  $\sum_{n=3}^{\infty} \frac{3n - 4}{n^2 - 2n}$

23.  $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$

24.  $\sum_{n=2}^{\infty} \frac{\ln n}{n^2}$

25.  $\sum_{k=1}^{\infty} ke^{-k}$

26.  $\sum_{k=1}^{\infty} ke^{-k^2}$

27.  $\sum_{n=1}^{\infty} \frac{1}{n^2 + n^3}$

28.  $\sum_{n=1}^{\infty} \frac{n}{n^4 + 1}$

**29–30** Explain why the Integral Test can't be used to determine whether the series is convergent.

29.  $\sum_{n=1}^{\infty} \frac{\cos \pi n}{\sqrt{n}}$

30.  $\sum_{n=1}^{\infty} \frac{\cos^2 n}{1 + n^2}$

**31–34** Find the values of  $p$  for which the series is convergent.

31.  $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^p}$

32.  $\sum_{n=3}^{\infty} \frac{1}{n \ln n [\ln(\ln n)]^p}$

33.  $\sum_{n=1}^{\infty} n(1 + n^2)^p$

34.  $\sum_{n=1}^{\infty} \frac{\ln n}{n^p}$

**35–37** **The Riemann Zeta Function** The function  $\zeta$  defined by

$$\zeta(s) = \sum_{n=1}^{\infty} \frac{1}{n^s}$$

where  $s$  is a complex number, is called the *Riemann zeta function*.

**35.** For which real numbers  $x$  is  $\zeta(x)$  defined?

**36.** Leonhard Euler was able to calculate the exact sum of the  $p$ -series with  $p = 2$ :

$$\zeta(2) = \sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$$

Use this fact to find the sum of each series.

(a)  $\sum_{n=2}^{\infty} \frac{1}{n^2}$

(b)  $\sum_{n=3}^{\infty} \frac{1}{(n+1)^2}$

(c)  $\sum_{n=1}^{\infty} \frac{1}{(2n)^2}$

**37.** Euler also found the sum of the  $p$ -series with  $p = 4$ :

$$\zeta(4) = \sum_{n=1}^{\infty} \frac{1}{n^4} = \frac{\pi^4}{90}$$

Use Euler's result to find the sum of the series.

(a)  $\sum_{n=1}^{\infty} \left(\frac{3}{n}\right)^4$

(b)  $\sum_{k=5}^{\infty} \frac{1}{(k-2)^4}$

- 38.** (a) Find the partial sum  $s_{10}$  of the series  $\sum_{n=1}^{\infty} 1/n^4$ . Estimate the error in using  $s_{10}$  as an approximation to the sum of the series.  
 (b) Use (3) with  $n = 10$  to give an improved estimate of the sum.  
 (c) Compare your estimate in part (b) with the exact value given in Exercise 37.  
 (d) Find a value of  $n$  so that  $s_n$  is within 0.00001 of the sum.

- 39.** (a) Use the sum of the first 10 terms to estimate the sum of the series  $\sum_{n=1}^{\infty} 1/n^2$ . How good is this estimate?  
 (b) Improve this estimate using (3) with  $n = 10$ .  
 (c) Compare your estimate in part (b) with the exact value given in Exercise 36.  
 (d) Find a value of  $n$  that will ensure that the error in the approximation  $s \approx s_n$  is less than 0.001.

- 40.** Find the sum of the series  $\sum_{n=1}^{\infty} ne^{-2n}$  correct to four decimal places.

- 41.** Estimate  $\sum_{n=1}^{\infty} (2n+1)^{-6}$  correct to five decimal places.

- 42.** How many terms of the series  $\sum_{n=2}^{\infty} 1/[n(\ln n)^2]$  would you need to add to find its sum to within 0.01?

- 43.** Show that if we want to approximate the sum of the series  $\sum_{n=1}^{\infty} n^{-1.001}$  so that the error is less than 5 in the ninth decimal place, then we need to add more than  $10^{11.301}$  terms!

- T 44.** (a) Show that the series  $\sum_{n=1}^{\infty} (\ln n)^2/n^2$  is convergent.  
 (b) Find an upper bound for the error in the approximation  $s \approx s_n$ .  
 (c) What is the smallest value of  $n$  such that this upper bound is less than 0.05?  
 (d) Find  $s_n$  for this value of  $n$ .

- 45.** (a) Use (4) to show that if  $s_n$  is the  $n$ th partial sum of the harmonic series, then

$$s_n \leqslant 1 + \ln n$$

- (b) The harmonic series diverges, but very slowly. Use part (a) to show that the sum of the first million terms is less than 15 and the sum of the first billion terms is less than 22.

- 46.** Use the following steps to show that the sequence

$$t_n = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} - \ln n$$

has a limit. (The value of the limit is denoted by  $\gamma$  and is called Euler's constant.)

- (a) Draw a picture like Figure 6 with  $f(x) = 1/x$  and interpret  $t_n$  as an area [or use (5)] to show that  $t_n > 0$  for all  $n$ .

- (b) Interpret

$$t_n - t_{n+1} = [\ln(n+1) - \ln n] - \frac{1}{n+1}$$

as a difference of areas to show that  $t_n - t_{n+1} > 0$ . Therefore  $\{t_n\}$  is a decreasing sequence.

- (c) Use the Monotonic Sequence Theorem to show that  $\{t_n\}$  is convergent.

- 47.** Find all positive values of  $b$  for which the series  $\sum_{n=1}^{\infty} b^{\ln n}$  converges.

- 48.** Find all values of  $c$  for which the following series converges.

$$\sum_{n=1}^{\infty} \left( \frac{c}{n} - \frac{1}{n+1} \right)$$

## 11.4 | The Comparison Tests

In the comparison tests the idea is to compare a given series with a series that is known to be convergent or divergent. If two series have only positive terms, we can compare corresponding terms directly to see which are larger (the Direct Comparison Test) or we can investigate the limit of the ratios of corresponding terms (the Limit Comparison Test).

### The Direct Comparison Test

Let's consider the two series

$$\sum_{n=1}^{\infty} \frac{1}{2^n + 1} \quad \text{and} \quad \sum_{n=1}^{\infty} \frac{1}{2^n}$$

The second series  $\sum_{n=1}^{\infty} 1/2^n$  is a geometric series with  $a = \frac{1}{2}$  and  $r = \frac{1}{2}$  and is therefore convergent. Since these series are so similar, we may have the feeling that the first series must converge also. In fact, it does. The inequality

$$\frac{1}{2^n + 1} < \frac{1}{2^n}$$

shows that the series  $\sum 1/(2^n + 1)$  has smaller terms than those of the geometric series  $\sum 1/2^n$  and therefore all its partial sums are also smaller than 1 (the sum of the geometric series). This means that its partial sums form a bounded increasing sequence, which is convergent. It also follows that the sum of the series is less than the sum of the geometric series:

$$\sum_{n=1}^{\infty} \frac{1}{2^n + 1} < 1$$

Similar reasoning can be used to prove the following test, which applies only to series whose terms are positive. The first part says that if we have a series whose terms are *smaller* than those of a known *convergent* series, then our series is also convergent. The second part says that if we start with a series whose terms are *larger* than those of a known *divergent* series, then it too is divergent.

**The Direct Comparison Test** Suppose that  $\sum a_n$  and  $\sum b_n$  are series with positive terms.

- (i) If  $\sum b_n$  is convergent and  $a_n \leq b_n$  for all  $n$ , then  $\sum a_n$  is also convergent.
- (ii) If  $\sum b_n$  is divergent and  $a_n \geq b_n$  for all  $n$ , then  $\sum a_n$  is also divergent.

**PROOF**

It is important to keep in mind the distinction between a sequence and a series. A sequence is a list of numbers, whereas a series is a sum. With every series  $\sum a_n$  there are two associated sequences: the sequence  $\{a_n\}$  of terms and the sequence  $\{s_n\}$  of partial sums.

**Standard series for use with the comparison tests**

$$(i) \text{ Let } s_n = \sum_{i=1}^n a_i \quad t_n = \sum_{i=1}^n b_i \quad t = \sum_{n=1}^{\infty} b_n$$

Since both series have positive terms, the sequences  $\{s_n\}$  and  $\{t_n\}$  are increasing ( $s_{n+1} = s_n + a_{n+1} \geq s_n$ ). Also  $t_n \rightarrow t$ , so  $t_n \leq t$  for all  $n$ . Since  $a_i \leq b_i$ , we have  $s_n \leq t_n$ . Thus  $s_n \leq t$  for all  $n$ . This means that  $\{s_n\}$  is increasing and bounded above and therefore converges by the Monotonic Sequence Theorem. Thus  $\sum a_n$  converges.

(ii) If  $\sum b_n$  is divergent, then  $t_n \rightarrow \infty$  (since  $\{t_n\}$  is increasing). But  $a_i \geq b_i$  so  $s_n \geq t_n$ . Thus  $s_n \rightarrow \infty$ . Therefore  $\sum a_n$  diverges. ■

In using the Direct Comparison Test we must, of course, have some known series  $\sum b_n$  for the purpose of comparison. Most of the time we use one of these series:

- A  $p$ -series [ $\sum 1/n^p$  converges if  $p > 1$  and diverges if  $p \leq 1$ ; see (11.3.1)]
- A geometric series [ $\sum ar^{n-1}$  converges if  $|r| < 1$  and diverges if  $|r| \geq 1$ ; see (11.2.4)]

**EXAMPLE 1** Determine whether the series  $\sum_{n=1}^{\infty} \frac{5}{2n^2 + 4n + 3}$  converges or diverges.

**SOLUTION** For large  $n$  the dominant term in the denominator is  $2n^2$ , so we compare the given series with the series  $\sum 5/(2n^2)$ . Observe that

$$\frac{5}{2n^2 + 4n + 3} < \frac{5}{2n^2}$$

because the left side has a bigger denominator. (In the notation of the Direct Comparison Test,  $a_n$  is the left side and  $b_n$  is the right side.) We know that

$$\sum_{n=1}^{\infty} \frac{5}{2n^2} = \frac{5}{2} \sum_{n=1}^{\infty} \frac{1}{n^2}$$

is convergent because it's a constant times a  $p$ -series with  $p = 2 > 1$ . Therefore

$$\sum_{n=1}^{\infty} \frac{5}{2n^2 + 4n + 3}$$

is convergent by part (i) of the Direct Comparison Test. ■

**NOTE** Although the condition  $a_n \leq b_n$  or  $a_n \geq b_n$  in the Direct Comparison Test is given for all  $n$ , we need verify only that it holds for  $n \geq N$ , where  $N$  is some fixed integer, because the convergence of a series is not affected by a finite number of terms. This is illustrated in the next example.

**EXAMPLE 2** Test the series  $\sum_{k=1}^{\infty} \frac{\ln k}{k}$  for convergence or divergence.

**SOLUTION** We used the Integral Test to test this series in Example 11.3.4, but we can also test it by comparing it with the harmonic series. Observe that  $\ln k > 1$  for  $k \geq 3$  and so

$$\frac{\ln k}{k} > \frac{1}{k} \quad k \geq 3$$

We know that  $\sum 1/k$  is divergent ( $p$ -series with  $p = 1$ ). Thus the given series is divergent by the Direct Comparison Test. ■

### ■ Limit Comparison Test

The Direct Comparison Test is conclusive only if the terms of the series being tested are smaller than those of a convergent series or larger than those of a divergent series. If the terms are larger than the terms of a convergent series or smaller than those of a divergent series, then the Direct Comparison Test doesn't apply. Consider, for instance, the series

$$\sum_{n=1}^{\infty} \frac{1}{2^n - 1}$$

The inequality

$$\frac{1}{2^n - 1} > \frac{1}{2^n}$$

is useless as far as the Direct Comparison Test is concerned because  $\sum b_n = \sum (\frac{1}{2})^n$  is convergent and  $a_n > b_n$ . Nonetheless, we have the feeling that  $\sum 1/(2^n - 1)$  ought to be convergent because it is very similar to the convergent geometric series  $\sum (\frac{1}{2})^n$ . In such cases the following test can be used.

**The Limit Comparison Test** Suppose that  $\sum a_n$  and  $\sum b_n$  are series with positive terms. If

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = c$$

where  $c$  is a finite number and  $c > 0$ , then either both series converge or both diverge.

Exercises 48 and 49 deal with the cases  $c = 0$  and  $c = \infty$ .

**PROOF** Let  $m$  and  $M$  be positive numbers such that  $m < c < M$ . Because  $a_n/b_n$  is close to  $c$  for large  $n$ , there is an integer  $N$  such that

$$m < \frac{a_n}{b_n} < M \quad \text{when } n > N$$

and so

$$mb_n < a_n < Mb_n \quad \text{when } n > N$$

If  $\sum b_n$  converges, so does  $\sum Mb_n$ . Thus  $\sum a_n$  converges by part (i) of the Direct Comparison Test. If  $\sum b_n$  diverges, so does  $\sum mb_n$  and part (ii) of the Direct Comparison Test shows that  $\sum a_n$  diverges. ■

**EXAMPLE 3** Test the series  $\sum_{n=1}^{\infty} \frac{1}{2^n - 1}$  for convergence or divergence.

**SOLUTION** We use the Limit Comparison Test with

$$a_n = \frac{1}{2^n - 1} \quad b_n = \frac{1}{2^n}$$

and obtain

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{1/(2^n - 1)}{1/2^n} = \lim_{n \rightarrow \infty} \frac{2^n}{2^n - 1} = \lim_{n \rightarrow \infty} \frac{1}{1 - 1/2^n} = 1 > 0$$

Since this limit exists and  $\Sigma 1/2^n$  is a convergent geometric series, the given series converges by the Limit Comparison Test. ■

**EXAMPLE 4** Determine whether the series  $\sum_{n=1}^{\infty} \frac{2n^2 + 3n}{\sqrt{5 + n^5}}$  converges or diverges.

**SOLUTION** The dominant part of the numerator is  $2n^2$  and the dominant part of the denominator is  $\sqrt{n^5} = n^{5/2}$ . This suggests taking

$$\begin{aligned} a_n &= \frac{2n^2 + 3n}{\sqrt{5 + n^5}} \quad b_n = \frac{2n^2}{n^{5/2}} = \frac{2}{n^{1/2}} \\ \lim_{n \rightarrow \infty} \frac{a_n}{b_n} &= \lim_{n \rightarrow \infty} \frac{2n^2 + 3n}{\sqrt{5 + n^5}} \cdot \frac{n^{1/2}}{2} = \lim_{n \rightarrow \infty} \frac{2n^{5/2} + 3n^{3/2}}{2\sqrt{5 + n^5}} \\ &= \lim_{n \rightarrow \infty} \frac{2 + \frac{3}{n}}{2\sqrt{\frac{5}{n^5} + 1}} = \frac{2 + 0}{2\sqrt{0 + 1}} = 1 \end{aligned}$$

Since  $\Sigma b_n = 2 \Sigma 1/n^{1/2}$  is divergent ( $p$ -series with  $p = \frac{1}{2} < 1$ ), the given series diverges by the Limit Comparison Test. ■

Notice that in testing many series we find a suitable comparison series  $\Sigma b_n$  by keeping only the highest powers in the numerator and denominator.

### ■ Estimating Sums

If we have used the Direct Comparison Test to show that a series  $\Sigma a_n$  converges by comparison with a series  $\Sigma b_n$ , then we may be able to estimate the sum  $\Sigma a_n$  by comparing remainders. As in Section 11.3, we consider the remainder

$$R_n = s - s_n = a_{n+1} + a_{n+2} + \dots$$

For the comparison series  $\Sigma b_n$  we consider the corresponding remainder

$$T_n = t - t_n = b_{n+1} + b_{n+2} + \dots$$

Since  $a_n \leq b_n$  for all  $n$ , we have  $R_n \leq T_n$ . If  $\Sigma b_n$  is a  $p$ -series, we can estimate its remainder  $T_n$  as in Section 11.3. If  $\Sigma b_n$  is a geometric series, then  $T_n$  is the sum of a geometric series and we can sum it exactly (see Exercises 43 and 44). In either case we know that  $R_n$  is smaller than  $T_n$ .

**EXAMPLE 5** Use the sum of the first 100 terms to approximate the sum of the series  $\Sigma 1/(n^3 + 1)$ . Estimate the error involved in this approximation.

**SOLUTION** Since

$$\frac{1}{n^3 + 1} < \frac{1}{n^3}$$

the given series is convergent by the Direct Comparison Test. The remainder  $T_n$  for the comparison series  $\Sigma 1/n^3$  was estimated in Example 11.3.5 using the Remainder Estimate for the Integral Test. There we found that

$$T_n \leq \int_n^{\infty} \frac{1}{x^3} dx = \frac{1}{2n^2}$$

Therefore the remainder  $R_n$  for the given series satisfies

$$R_n \leq T_n \leq \frac{1}{2n^2}$$

With  $n = 100$  we have

$$R_{100} \leq \frac{1}{2(100)^2} = 0.00005$$

Using a calculator or a computer, we find that

$$\sum_{n=1}^{\infty} \frac{1}{n^3 + 1} \approx \sum_{n=1}^{100} \frac{1}{n^3 + 1} \approx 0.6864538$$

with error less than 0.00005. ■

## 11.4 Exercises

1. Suppose  $\sum a_n$  and  $\sum b_n$  are series with positive terms and  $\sum b_n$  is known to be convergent.

- (a) If  $a_n > b_n$  for all  $n$ , what can you say about  $\sum a_n$ ? Why?  
 (b) If  $a_n < b_n$  for all  $n$ , what can you say about  $\sum a_n$ ? Why?

2. Suppose  $\sum a_n$  and  $\sum b_n$  are series with positive terms and  $\sum b_n$  is known to be divergent.

- (a) If  $a_n > b_n$  for all  $n$ , what can you say about  $\sum a_n$ ? Why?  
 (b) If  $a_n < b_n$  for all  $n$ , what can you say about  $\sum a_n$ ? Why?

3. (a) Use the Direct Comparison Test to show that the first series converges by comparing it to the second series.

$$\sum_{n=2}^{\infty} \frac{n}{n^3 + 5} \quad \sum_{n=2}^{\infty} \frac{1}{n^2}$$

- (b) Use the Limit Comparison Test to show that the first series converges by comparing it to the second series.

$$\sum_{n=2}^{\infty} \frac{n}{n^3 - 5} \quad \sum_{n=2}^{\infty} \frac{1}{n^2}$$

4. (a) Use the Direct Comparison Test to show that the first series diverges by comparing it to the second series.

$$\sum_{n=2}^{\infty} \frac{n^2 + n}{n^3 - 2} \quad \sum_{n=2}^{\infty} \frac{1}{n}$$

- (b) Use the Limit Comparison Test to show that the first series diverges by comparing it to the second series.

$$\sum_{n=2}^{\infty} \frac{n^2 - n}{n^3 + 2} \quad \sum_{n=2}^{\infty} \frac{1}{n}$$

5. Which of the following inequalities can be used to show that  $\sum_{n=1}^{\infty} n/(n^3 + 1)$  converges?

- (a)  $\frac{n}{n^3 + 1} \geq \frac{1}{n^3 + 1}$       (b)  $\frac{n}{n^3 + 1} \leq \frac{1}{n}$   
 (c)  $\frac{n}{n^3 + 1} \leq \frac{1}{n^2}$

6. Which of the following inequalities can be used to show that  $\sum_{n=1}^{\infty} n/(n^2 + 1)$  diverges?

- (a)  $\frac{n}{n^2 + 1} \geq \frac{1}{n^2 + 1}$       (b)  $\frac{n}{n^2 + 1} \leq \frac{1}{n}$   
 (c)  $\frac{n}{n^2 + 1} \geq \frac{1}{2n}$

- 7–40 Determine whether the series converges or diverges.

7.  $\sum_{n=1}^{\infty} \frac{1}{n^3 + 8}$

8.  $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n} - 1}$

9.  $\sum_{n=1}^{\infty} \frac{n + 1}{n\sqrt{n}}$

10.  $\sum_{n=1}^{\infty} \frac{n - 1}{n^3 + 1}$

11.  $\sum_{n=1}^{\infty} \frac{9^n}{3 + 10^n}$

12.  $\sum_{n=1}^{\infty} \frac{6^n}{5^n - 1}$

13.  $\sum_{n=2}^{\infty} \frac{1}{\ln n}$

14.  $\sum_{k=1}^{\infty} \frac{k \sin^2 k}{1 + k^3}$

15.  $\sum_{k=1}^{\infty} \frac{\sqrt[3]{k}}{\sqrt{k^3 + 4k + 3}}$

16.  $\sum_{k=1}^{\infty} \frac{(2k - 1)(k^2 - 1)}{(k + 1)(k^2 + 4)^2}$

17.  $\sum_{n=1}^{\infty} \frac{1 + \cos n}{e^n}$

18.  $\sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{3n^4 + 1}}$

19.  $\sum_{n=1}^{\infty} \frac{4^{n+1}}{3^n - 2}$

20.  $\sum_{n=1}^{\infty} \frac{1}{n^n}$

21.  $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^2 + 1}}$

22.  $\sum_{n=1}^{\infty} \frac{2}{\sqrt{n} + 2}$

23.  $\sum_{n=1}^{\infty} \frac{n + 1}{n^3 + n}$

24.  $\sum_{n=1}^{\infty} \frac{n^2 + n + 1}{n^4 + n^2}$

25.  $\sum_{n=1}^{\infty} \frac{\sqrt{1+n}}{2+n}$

26.  $\sum_{n=3}^{\infty} \frac{n+2}{(n+1)^3}$

27.  $\sum_{n=1}^{\infty} \frac{5+2n}{(1+n^2)^2}$

28.  $\sum_{n=1}^{\infty} \frac{n+3^n}{n+2^n}$

29.  $\sum_{n=1}^{\infty} \frac{e^n+1}{ne^n+1}$

30.  $\sum_{n=2}^{\infty} \frac{1}{n\sqrt{n^2-1}}$

31.  $\sum_{n=1}^{\infty} \frac{2+\sin n}{n^2}$

32.  $\sum_{n=1}^{\infty} \frac{n^2+\cos^2 n}{n^3}$

33.  $\sum_{n=1}^{\infty} \left(1 + \frac{1}{n}\right)^2 e^{-n}$

34.  $\sum_{n=1}^{\infty} \frac{e^{1/n}}{n}$

35.  $\sum_{n=1}^{\infty} \frac{1}{n!}$

36.  $\sum_{n=1}^{\infty} \frac{n!}{n^n}$

37.  $\sum_{n=1}^{\infty} \sin\left(\frac{1}{n}\right)$

38.  $\sum_{n=1}^{\infty} \sin^2\left(\frac{1}{n}\right)$

39.  $\sum_{n=1}^{\infty} \frac{1}{n} \tan \frac{1}{n}$

40.  $\sum_{n=1}^{\infty} \frac{1}{n^{1+1/n}}$

**41–44** Use the sum of the first 10 terms to approximate the sum of the series. Estimate the error.

41.  $\sum_{n=1}^{\infty} \frac{1}{5+n^5}$

42.  $\sum_{n=1}^{\infty} \frac{e^{1/n}}{n^4}$

43.  $\sum_{n=1}^{\infty} 5^{-n} \cos^2 n$

44.  $\sum_{n=1}^{\infty} \frac{1}{3^n+4^n}$

**45.** The meaning of the decimal representation of a number  $0.d_1d_2d_3\dots$  (where the digit  $d_i$  is one of the numbers 0, 1, 2, ..., 9) is that

$$0.d_1d_2d_3d_4\dots = \frac{d_1}{10} + \frac{d_2}{10^2} + \frac{d_3}{10^3} + \frac{d_4}{10^4} + \dots$$

Show that this series converges for all choices of  $d_1, d_2, \dots$ .

**46.** For what values of  $p$  does the series  $\sum_{n=2}^{\infty} 1/(n^p \ln n)$  converge?

**47.** Show that

$$\sum_{n=2}^{\infty} \frac{1}{(\ln n)^{\ln \ln n}}$$

diverges. [Hint: Use Formula 1.5.10 ( $x^r = e^{r \ln x}$ ) and the fact that  $\ln x < \sqrt{x}$  for  $x \geq 1$ .]

- 48.** (a) Suppose that  $\sum a_n$  and  $\sum b_n$  are series with positive terms and  $\sum b_n$  is convergent. Prove that if

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$$

then  $\sum a_n$  is also convergent.

- (b) Use part (a) to show that the series converges.

$$(i) \sum_{n=1}^{\infty} \frac{\ln n}{n^3} \quad (ii) \sum_{n=1}^{\infty} \left(1 - \cos \frac{1}{n^2}\right)$$

- 49.** (a) Suppose that  $\sum a_n$  and  $\sum b_n$  are series with positive terms and  $\sum b_n$  is divergent. Prove that if

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$$

then  $\sum a_n$  is also divergent.

- (b) Use part (a) to show that the series diverges.

$$(i) \sum_{n=2}^{\infty} \frac{1}{\ln n} \quad (ii) \sum_{n=1}^{\infty} \frac{\ln n}{n}$$

- 50.** Give an example of a pair of series  $\sum a_n$  and  $\sum b_n$  with positive terms where  $\lim_{n \rightarrow \infty} (a_n/b_n) = 0$  and  $\sum b_n$  diverges, but  $\sum a_n$  converges. (Compare with Exercise 48.)

- 51.** Show that if  $a_n > 0$  and  $\lim_{n \rightarrow \infty} na_n \neq 0$ , then  $\sum a_n$  is divergent.

- 52.** Show that if  $a_n > 0$  and  $\sum a_n$  is convergent, then  $\sum \ln(1+a_n)$  is convergent.

- 53.** If  $\sum a_n$  is a convergent series with positive terms, is it true that  $\sum \sin(a_n)$  is also convergent?

- 54.** Prove that if  $a_n \geq 0$  and  $\sum a_n$  converges, then  $\sum a_n^2$  also converges.

- 55.** Let  $\sum a_n$  and  $\sum b_n$  be series with positive terms. Is each of the following statements true or false? If the statement is false, give an example that disproves the statement.

- (a) If  $\sum a_n$  and  $\sum b_n$  are divergent, then  $\sum a_n b_n$  is divergent.

- (b) If  $\sum a_n$  converges and  $\sum b_n$  diverges, then  $\sum a_n b_n$  diverges.

- (c) If  $\sum a_n$  and  $\sum b_n$  are convergent, then  $\sum a_n b_n$  is convergent.

## 11.5 | Alternating Series and Absolute Convergence

The convergence tests that we have looked at so far apply only to series with positive terms. In this section and the next we learn how to deal with series whose terms are not necessarily positive. Of particular importance are *alternating series*, whose terms alternate in sign.

## ■ Alternating Series

An **alternating series** is a series whose terms are alternately positive and negative. Here are two examples:

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n}$$

$$-\frac{1}{2} + \frac{2}{3} - \frac{3}{4} + \frac{4}{5} - \frac{5}{6} + \frac{6}{7} - \dots = \sum_{n=1}^{\infty} (-1)^n \frac{n}{n+1}$$

We see from these examples that the  $n$ th term of an alternating series is of the form

$$a_n = (-1)^{n-1} b_n \quad \text{or} \quad a_n = (-1)^n b_n$$

where  $b_n$  is a positive number. (In fact,  $b_n = |a_n|$ .)

The following test says that if the terms of an alternating series decrease toward 0 in absolute value, then the series converges.

### Alternating Series Test

If the alternating series

$$\sum_{n=1}^{\infty} (-1)^{n-1} b_n = b_1 - b_2 + b_3 - b_4 + b_5 - b_6 + \dots \quad (b_n > 0)$$

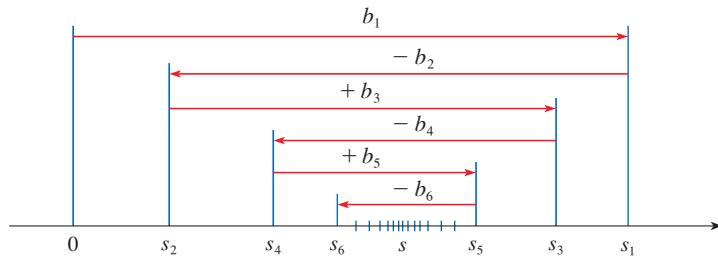

satisfies the conditions

$$(i) \quad b_{n+1} \leq b_n \quad \text{for all } n$$

$$(ii) \quad \lim_{n \rightarrow \infty} b_n = 0$$

then the series is convergent.

Before giving the proof let's look at Figure 1, which gives a picture of the idea behind the proof. We first plot  $s_1 = b_1$  on a number line. To find  $s_2$  we subtract  $b_2$ , so  $s_2$  is to the left of  $s_1$ . Then to find  $s_3$  we add  $b_3$ , so  $s_3$  is to the right of  $s_2$ . But, since  $b_3 < b_2$ ,  $s_3$  is to the left of  $s_1$ . Continuing in this manner, we see that the partial sums oscillate back and forth. Since  $b_n \rightarrow 0$ , the successive steps are becoming smaller and smaller. The even partial sums  $s_2, s_4, s_6, \dots$  are increasing and the odd partial sums  $s_1, s_3, s_5, \dots$  are decreasing. Thus it seems plausible that both are converging to some number  $s$ , which is the sum of the series. Therefore we consider the even and odd partial sums separately in the following proof.

**FIGURE 1**

**PROOF OF THE ALTERNATING SERIES TEST** We first consider the even partial sums:

$$s_2 = b_1 - b_2 \geq 0 \quad \text{since } b_2 \leq b_1$$

$$s_4 = s_2 + (b_3 - b_4) \geq s_2 \quad \text{since } b_4 \leq b_3$$

$$\text{In general} \quad s_{2n} = s_{2n-2} + (b_{2n-1} - b_{2n}) \geq s_{2n-2} \quad \text{since } b_{2n} \leq b_{2n-1}$$

$$\text{Thus} \quad 0 \leq s_2 \leq s_4 \leq s_6 \leq \dots \leq s_{2n} \leq \dots$$

But we can also write

$$s_{2n} = b_1 - (b_2 - b_3) - (b_4 - b_5) - \dots - (b_{2n-2} - b_{2n-1}) - b_{2n}$$

Every term in parentheses is positive, so  $s_{2n} \leq b_1$  for all  $n$ . Therefore the sequence  $\{s_{2n}\}$  of even partial sums is increasing and bounded above. It is therefore convergent by the Monotonic Sequence Theorem. Let's call its limit  $s$ , that is,

$$\lim_{n \rightarrow \infty} s_{2n} = s$$

Now we compute the limit of the odd partial sums:

$$\begin{aligned} \lim_{n \rightarrow \infty} s_{2n+1} &= \lim_{n \rightarrow \infty} (s_{2n} + b_{2n+1}) \\ &= \lim_{n \rightarrow \infty} s_{2n} + \lim_{n \rightarrow \infty} b_{2n+1} \\ &= s + 0 && [\text{by condition (ii)}] \\ &= s \end{aligned}$$

Figure 2 illustrates Example 1 by showing the graphs of the terms  $a_n = (-1)^{n-1}/n$  and the partial sums  $s_n$ . Notice how the values of  $s_n$  zig-zag across the limiting value, which appears to be about 0.7. In fact, it can be proved that the exact sum of the series is  $\ln 2 \approx 0.693$  (see Exercise 50).

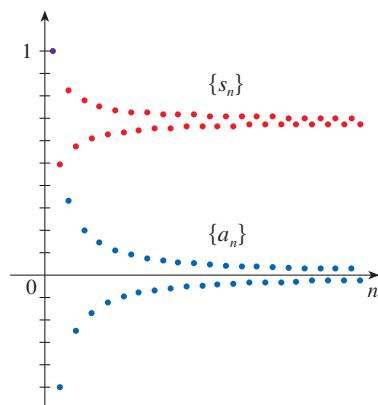

FIGURE 2

Since both the even and odd partial sums converge to  $s$ , we have  $\lim_{n \rightarrow \infty} s_n = s$  [see Exercise 11.1.98(a)] and so the series is convergent. ■

**EXAMPLE 1** The alternating harmonic series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n}$$

satisfies the conditions

$$(i) \quad b_{n+1} < b_n \quad \text{because} \quad \frac{1}{n+1} < \frac{1}{n}$$

$$(ii) \quad \lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

so the series is convergent by the Alternating Series Test. ■

**EXAMPLE 2** The series  $\sum_{n=1}^{\infty} \frac{(-1)^n 3n}{4n-1}$  is alternating, but

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{3n}{4n-1} = \lim_{n \rightarrow \infty} \frac{3}{4 - \frac{1}{n}} = \frac{3}{4}$$

so condition (ii) is not satisfied. Thus the Alternating Series Test doesn't apply. Instead, we look at the limit of the  $n$ th term of the series:

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{(-1)^n 3n}{4n - 1}$$

This limit does not exist, so the series diverges by the Test for Divergence. ■

**EXAMPLE 3** Test the series  $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{n^2}{n^3 + 1}$  for convergence or divergence.

**SOLUTION** The given series is alternating so we try to verify conditions (i) and (ii) of the Alternating Series Test.

Condition (i): Unlike the situation in Example 1, it is not obvious that the sequence given by  $b_n = n^2/(n^3 + 1)$  is decreasing. However, if we consider the related function  $f(x) = x^2/(x^3 + 1)$ , we find that

$$f'(x) = \frac{x(2 - x^3)}{(x^3 + 1)^2}$$

Since we are considering only positive  $x$ , we see that  $f'(x) < 0$  if  $2 - x^3 < 0$ , that is,  $x > \sqrt[3]{2}$ . Thus  $f$  is decreasing on the interval  $(\sqrt[3]{2}, \infty)$ . This means that  $f(n+1) < f(n)$  and therefore  $b_{n+1} < b_n$  when  $n \geq 2$ . (The inequality  $b_2 < b_1$  can be verified directly but all that really matters is that the sequence  $\{b_n\}$  is eventually decreasing.)

Condition (ii) is readily verified:

$$\lim_{n \rightarrow \infty} b_n = \lim_{n \rightarrow \infty} \frac{n^2}{n^3 + 1} = \lim_{n \rightarrow \infty} \frac{1/n}{1 + 1/n^3} = 0$$

Thus the given series is convergent by the Alternating Series Test. ■

Instead of verifying condition (i) of the Alternating Series Test by computing a derivative, we could verify that  $b_{n+1} < b_n$  directly by using the technique of Solution 1 in Example 11.1.13.

You can see geometrically why the Alternating Series Estimation Theorem is true by looking at Figure 1. Notice that  $s - s_4 < b_5$ ,  $|s - s_5| < b_6$ , and so on. Notice also that  $s$  lies between any two consecutive partial sums.

## ■ Estimating Sums of Alternating Series

A partial sum  $s_n$  of any convergent series can be used as an approximation to the total sum  $s$ , but this is not of much use unless we can estimate the accuracy of the approximation. The error involved in using  $s \approx s_n$  is the remainder  $R_n = s - s_n$ . The next theorem says that for series that satisfy the conditions of the Alternating Series Test, the size of the error is smaller than  $b_{n+1}$ , which is the absolute value of the first neglected term.

**Alternating Series Estimation Theorem** If  $s = \sum (-1)^{n-1} b_n$ , where  $b_n > 0$ , is the sum of an alternating series that satisfies

$$(i) \quad b_{n+1} \leq b_n \quad \text{and} \quad (ii) \quad \lim_{n \rightarrow \infty} b_n = 0$$

then

$$|R_n| = |s - s_n| \leq b_{n+1}$$

**PROOF** We know from the proof of the Alternating Series Test that  $s$  lies between any two consecutive partial sums  $s_n$  and  $s_{n+1}$ . (There we showed that  $s$  is larger than all the even partial sums. A similar argument shows that  $s$  is smaller than all the odd sums.) It follows that

$$|s - s_n| \leq |s_{n+1} - s_n| = b_{n+1}$$

By definition,  $0! = 1$ .

**EXAMPLE 4** Find the sum of the series  $\sum_{n=0}^{\infty} \frac{(-1)^n}{n!}$  correct to three decimal places.

**SOLUTION** We first observe that the series is convergent by the Alternating Series Test because

$$(i) \quad b_{n+1} = \frac{1}{(n+1)!} = \frac{1}{n!(n+1)} < \frac{1}{n!} = b_n$$

$$(ii) \quad 0 < \frac{1}{n!} < \frac{1}{n} \rightarrow 0 \quad \text{so } b_n = \frac{1}{n!} \rightarrow 0 \text{ as } n \rightarrow \infty$$

To get a feel for how many terms we need to use in our approximation, let's write out the first few terms of the series:

$$\begin{aligned} s &= \frac{1}{0!} - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \frac{1}{6!} - \frac{1}{7!} + \dots \\ &= 1 - 1 + \frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120} + \frac{1}{720} - \frac{1}{5040} + \dots \end{aligned}$$

Notice that

$$b_7 = \frac{1}{5040} < \frac{1}{5000} = 0.0002$$

and

$$s_6 = 1 - 1 + \frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120} + \frac{1}{720} \approx 0.368056$$

By the Alternating Series Estimation Theorem we know that

$$|s - s_6| \leq b_7 < 0.0002$$

This error of less than 0.0002 does not affect the third decimal place, so we have  $s \approx 0.368$  correct to three decimal places. ■

**NOTE** The rule that the error (in using  $s_n$  to approximate  $s$ ) is smaller than the first neglected term is, in general, valid only for alternating series that satisfy the conditions of the Alternating Series Estimation Theorem. **The rule does not apply to other types of series.**

## Absolute Convergence and Conditional Convergence

Given any series  $\sum a_n$ , we can consider the corresponding series

$$\sum_{n=1}^{\infty} |a_n| = |a_1| + |a_2| + |a_3| + \dots$$

whose terms are the absolute values of the terms of the original series.

We have discussed convergence tests for series with positive terms and for alternating series. But what if the signs of the terms switch back and forth irregularly? We will see in Example 7 that the idea of absolute convergence sometimes helps in such cases.

**1 Definition** A series  $\sum a_n$  is called **absolutely convergent** if the series of absolute values  $\sum |a_n|$  is convergent.

Notice that if  $\sum a_n$  is a series with positive terms, then  $|a_n| = a_n$  and so absolute convergence is the same as convergence in this case.

**EXAMPLE 5** The alternating series

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} = 1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$$

is absolutely convergent because

$$\sum_{n=1}^{\infty} \left| \frac{(-1)^{n-1}}{n^2} \right| = \sum_{n=1}^{\infty} \frac{1}{n^2} = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots$$

is a convergent  $p$ -series ( $p = 2$ ). ■

**2 Definition** A series  $\sum a_n$  is called **conditionally convergent** if it is convergent but not absolutely convergent; that is, if  $\sum a_n$  converges but  $\sum |a_n|$  diverges.

**EXAMPLE 6** We know from Example 1 that the alternating harmonic series

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$$

is convergent, but it is not absolutely convergent because the corresponding series of absolute values is

$$\sum_{n=1}^{\infty} \left| \frac{(-1)^{n-1}}{n} \right| = \sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \dots$$

which is the harmonic series ( $p$ -series with  $p = 1$ ) and is therefore divergent. Thus the alternating harmonic series is conditionally convergent. ■

Example 6 shows that it is possible for a series to be convergent but not absolutely convergent. However, the following theorem states that absolute convergence implies convergence.

**3 Theorem** If a series  $\sum a_n$  is absolutely convergent, then it is convergent.

**PROOF** Observe that the inequality

$$0 \leq a_n + |a_n| \leq 2|a_n|$$

is true because  $|a_n|$  is either  $a_n$  or  $-a_n$ . If  $\sum a_n$  is absolutely convergent, then  $\sum |a_n|$  is convergent, so  $\sum 2|a_n|$  is convergent. Therefore, by the Direct Comparison Test,  $\sum (a_n + |a_n|)$  is convergent. Then

$$\sum a_n = \sum (a_n + |a_n|) - \sum |a_n|$$

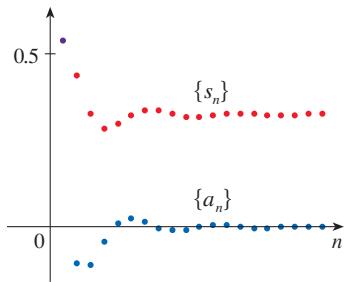

is the difference of two convergent series and is therefore convergent. ■

**EXAMPLE 7** Determine whether the series

$$\sum_{n=1}^{\infty} \frac{\cos n}{n^2} = \frac{\cos 1}{1^2} + \frac{\cos 2}{2^2} + \frac{\cos 3}{3^2} + \dots$$

is convergent or divergent.

Figure 3 shows the graphs of the terms  $a_n$  and partial sums  $s_n$  of the series in Example 7. Notice that the series is not alternating but has positive and negative terms.

**FIGURE 3**

**SOLUTION** This series has both positive and negative terms, but it is not alternating. (The first term is positive, the next three are negative, and the following three are positive: the signs change irregularly.) We can apply the Direct Comparison Test to the series of absolute values

$$\sum_{n=1}^{\infty} \left| \frac{\cos n}{n^2} \right| = \sum_{n=1}^{\infty} \frac{|\cos n|}{n^2}$$

Since  $|\cos n| \leq 1$  for all  $n$ , we have

$$\frac{|\cos n|}{n^2} \leq \frac{1}{n^2}$$

We know that  $\sum 1/n^2$  is convergent ( $p$ -series with  $p = 2$ ) and therefore  $\sum |\cos n|/n^2$  is convergent by the Direct Comparison Test. Thus the given series  $\sum (\cos n)/n^2$  is absolutely convergent and therefore convergent by Theorem 3. ■

**EXAMPLE 8** Determine whether the series is absolutely convergent, conditionally convergent, or divergent.

$$(a) \sum_{n=1}^{\infty} \frac{(-1)^n}{n^3} \quad (b) \sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt[3]{n}} \quad (c) \sum_{n=1}^{\infty} (-1)^n \frac{n}{2n+1}$$

**SOLUTION**

(a) Because the series

$$\sum_{n=1}^{\infty} \left| \frac{(-1)^n}{n^3} \right| = \sum_{n=1}^{\infty} \frac{1}{n^3}$$

converges ( $p$ -series with  $p = 3$ ), the given series is absolutely convergent.

(b) We first test for absolute convergence. The series

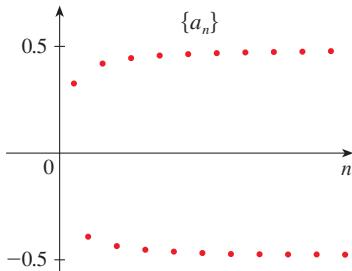

$$\sum_{n=1}^{\infty} \left| \frac{(-1)^n}{\sqrt[3]{n}} \right| = \sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{n}}$$

diverges ( $p$ -series with  $p = \frac{1}{3}$ ), so the given series is *not* absolutely convergent. The given series converges by the Alternating Series Test ( $b_{n+1} \leq b_n$  and  $\lim_{n \rightarrow \infty} b_n = 0$ ). Since the series converges but is not absolutely convergent, it is conditionally convergent.

(c) This series is alternating but

$$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (-1)^n \frac{n}{2n+1}$$

does not exist (see Figure 4), so the series diverges by the Test for Divergence. ■

**FIGURE 4**

The terms of  $\{a_n\}$  are alternately close to 0.5 and  $-0.5$ .

## Rearrangements

The question of whether a given convergent series is absolutely convergent or conditionally convergent has a bearing on the question of whether infinite sums behave like finite sums.

If we rearrange the order of the terms in a finite sum, then of course the value of the sum remains unchanged. But this is not always the case for an infinite series. By a **rearrangement** of an infinite series  $\sum a_n$  we mean a series obtained by simply changing the

order of the terms. For instance, a rearrangement of  $\sum a_n$  could start as follows:

$$a_1 + a_2 + a_5 + a_3 + a_4 + a_{15} + a_6 + a_7 + a_{20} + \dots$$

It turns out that

if  $\sum a_n$  is an absolutely convergent series with sum  $s$ ,  
then any rearrangement of  $\sum a_n$  has the same sum  $s$ .

However, any conditionally convergent series can be rearranged to give a different sum. To illustrate this fact let's consider the alternating harmonic series from Example 1. In Exercise 50 you are asked to show that

$$\boxed{4} \quad 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \dots = \ln 2$$

If we multiply this series by  $\frac{1}{2}$ , we get

$$\frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8} + \dots = \frac{1}{2} \ln 2$$

Inserting zeros between the terms of this series, we have

$$\boxed{5} \quad 0 + \frac{1}{2} + 0 - \frac{1}{4} + 0 + \frac{1}{6} + 0 - \frac{1}{8} + \dots = \frac{1}{2} \ln 2$$

Now we add the series in Equations 4 and 5 using Theorem 11.2.8:

$$\boxed{6} \quad 1 + \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \frac{1}{7} - \frac{1}{4} + \dots = \frac{3}{2} \ln 2$$

Adding these zeros does not affect the sum of the series; each term in the sequence of partial sums is repeated, but the limit is the same.

Notice that the series in (6) contains the same terms as in (4) but rearranged so that one negative term occurs after each pair of positive terms. The sums of these series, however, are different. In fact, Riemann proved that

if  $\sum a_n$  is a conditionally convergent series and  $r$  is any real number whatsoever, then there is a rearrangement of  $\sum a_n$  that has a sum equal to  $r$ .

A proof of this fact is outlined in Exercise 52.

## 11.5 Exercises

1. (a) What is an alternating series?

(b) Under what conditions does an alternating series converge?

(c) If these conditions are satisfied, what can you say about the remainder after  $n$  terms?

**2-20** Test the series for convergence or divergence.

2.  $\frac{2}{3} - \frac{2}{5} + \frac{2}{7} - \frac{2}{9} + \frac{2}{11} - \dots$

3.  $-\frac{2}{5} + \frac{4}{6} - \frac{6}{7} + \frac{8}{8} - \frac{10}{9} + \dots$

4.  $\frac{1}{\ln 3} - \frac{1}{\ln 4} + \frac{1}{\ln 5} - \frac{1}{\ln 6} + \frac{1}{\ln 7} - \dots$

5.  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{3+5n}$

7.  $\sum_{n=1}^{\infty} (-1)^n \frac{3n-1}{2n+1}$

6.  $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n+1}}$

8.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2}{n^2+n+1}$

9.  $\sum_{n=1}^{\infty} (-1)^n e^{-n}$

10.  $\sum_{n=1}^{\infty} (-1)^n \frac{\sqrt{n}}{2n+3}$

11.  $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{n^2}{n^3+4}$

12.  $\sum_{n=1}^{\infty} (-1)^n \frac{n}{2^n}$

13.  $\sum_{n=1}^{\infty} (-1)^{n-1} e^{2/n}$

14.  $\sum_{n=1}^{\infty} (-1)^{n-1} \arctan n$

15.  $\sum_{n=0}^{\infty} \frac{\sin(n+\frac{1}{2})\pi}{1+\sqrt{n}}$

16.  $\sum_{n=1}^{\infty} \frac{n \cos n\pi}{2^n}$

17.  $\sum_{n=1}^{\infty} (-1)^n \sin \frac{\pi}{n}$

18.  $\sum_{n=1}^{\infty} (-1)^n \cos \frac{\pi}{n}$

19.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2}{5^n}$

20.  $\sum_{n=1}^{\infty} (-1)^n (\sqrt{n+1} - \sqrt{n})$

- 21.** (a) What does it mean for a series to be absolutely convergent?  
 (b) What does it mean for a series to be conditionally convergent?  
 (c) If the series of positive terms  $\sum_{n=1}^{\infty} b_n$  converges, then what can you say about the series  $\sum_{n=1}^{\infty} (-1)^n b_n$ ?

**22–34** Determine whether the series is absolutely convergent, conditionally convergent, or divergent.

**22.**  $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^4}$

**23.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{\sqrt[3]{n^2}}$

**24.**  $\sum_{n=0}^{\infty} (-1)^{n+1} \frac{n^2}{n^2 + 1}$

**25.**  $\sum_{n=1}^{\infty} \frac{(-1)^n}{5n + 1}$

**26.**  $\sum_{n=1}^{\infty} \frac{-n}{n^2 + 1}$

**27.**  $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^2 + 1}$

**28.**  $\sum_{n=1}^{\infty} \frac{\sin n}{2^n}$

**29.**  $\sum_{n=1}^{\infty} \frac{1 + 2 \sin n}{n^3}$

**30.**  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{n}{n^2 + 4}$

**31.**  $\sum_{n=2}^{\infty} \frac{(-1)^n}{\ln n}$

**32.**  $\sum_{n=1}^{\infty} (-1)^n \frac{n}{\sqrt{n^3 + 2}}$

**33.**  $\sum_{n=1}^{\infty} \frac{\cos n\pi}{3n + 2}$

**34.**  $\sum_{n=2}^{\infty} \frac{(-1)^n}{n \ln n}$

 **35–36** Graph both the sequence of terms and the sequence of partial sums on the same screen. Use the graph to make a rough estimate of the sum of the series. Then use the Alternating Series Estimation Theorem to estimate the sum correct to four decimal places.

**35.**  $\sum_{n=1}^{\infty} \frac{(-0.8)^n}{n!}$

**36.**  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{n}{8^n}$

**37–40** Show that the series is convergent. How many terms of the series do we need to add in order to find the sum to the indicated accuracy?

**37.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^6}$  ( $|\text{error}| < 0.00005$ )

**38.**  $\sum_{n=1}^{\infty} \frac{(-\frac{1}{3})^n}{n}$  ( $|\text{error}| < 0.0005$ )

**39.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2 2^n}$  ( $|\text{error}| < 0.0005$ )

**40.**  $\sum_{n=1}^{\infty} \left( -\frac{1}{n} \right)^n$  ( $|\text{error}| < 0.00005$ )

**41–44** Approximate the sum of the series correct to four decimal places.

**41.**  $\sum_{n=1}^{\infty} \frac{(-1)^n}{(2n)!}$

**42.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^6}$

**43.**  $\sum_{n=1}^{\infty} (-1)^n n e^{-2n}$

**44.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n 4^n}$

**45.** Is the 50th partial sum  $s_{50}$  of the alternating series  $\sum_{n=1}^{\infty} (-1)^{n-1}/n$  an overestimate or an underestimate of the total sum? Explain.

**46–48** For what values of  $p$  is each series convergent?

**46.**  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^p}$

**47.**  $\sum_{n=1}^{\infty} \frac{(-1)^n}{n + p}$

**48.**  $\sum_{n=2}^{\infty} (-1)^{n-1} \frac{(\ln n)^p}{n}$

**49.** Show that the series  $\sum (-1)^{n-1} b_n$ , where  $b_n = 1/n$  if  $n$  is odd and  $b_n = 1/n^2$  if  $n$  is even, is divergent. Why does the Alternating Series Test not apply?

**50.** Use the following steps to show that

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} = \ln 2$$

Let  $h_n$  and  $s_n$  be the partial sums of the harmonic and alternating harmonic series.

(a) Show that  $s_{2n} = h_{2n} - h_n$ .

(b) From Exercise 11.3.46 we have

$$h_n - \ln n \rightarrow \gamma \quad \text{as } n \rightarrow \infty$$

and therefore

$$h_{2n} - \ln(2n) \rightarrow \gamma \quad \text{as } n \rightarrow \infty$$

Use these facts together with part (a) to show that  $s_{2n} \rightarrow \ln 2$  as  $n \rightarrow \infty$ .

**51.** Given any series  $\sum a_n$ , we define a series  $\sum a_n^+$  whose terms are all the positive terms of  $\sum a_n$  and a series  $\sum a_n^-$  whose terms are all the negative terms of  $\sum a_n$ . To be specific, we let

$$a_n^+ = \frac{a_n + |a_n|}{2} \quad a_n^- = \frac{a_n - |a_n|}{2}$$

Notice that if  $a_n > 0$ , then  $a_n^+ = a_n$  and  $a_n^- = 0$ , whereas if  $a_n < 0$ , then  $a_n^- = a_n$  and  $a_n^+ = 0$ .

- (a) If  $\sum a_n$  is absolutely convergent, show that both of the series  $\sum a_n^+$  and  $\sum a_n^-$  are convergent.  
 (b) If  $\sum a_n$  is conditionally convergent, show that both of the series  $\sum a_n^+$  and  $\sum a_n^-$  are divergent.

52. Prove that if  $\sum a_n$  is a conditionally convergent series and  $r$  is any real number, then there is a rearrangement of  $\sum a_n$  whose sum is  $r$ . [Hints: Use the notation of Exercise 51. Take just enough positive terms  $a_n^+$  so that their sum is greater than  $r$ . Then add just enough negative terms  $a_n^-$  so that the cumulative sum is less than  $r$ . Continue in this manner and use Theorem 11.2.6.]

53. Suppose the series  $\sum a_n$  is conditionally convergent.

- Prove that the series  $\sum n^2 a_n$  is divergent.
- Conditional convergence of  $\sum a_n$  is not enough to determine whether  $\sum n a_n$  is convergent. Show this by giving an example of a conditionally convergent series such that  $\sum n a_n$  converges and an example where  $\sum n a_n$  diverges.

## 11.6 | The Ratio and Root Tests

One way to determine how quickly the terms of a series are decreasing (or increasing) is to calculate the ratios of consecutive terms. For a geometric series  $\sum ar^{n-1}$  we have  $|a_{n+1}/a_n| = |r|$  for all  $n$ , and the series converges if  $|r| < 1$ . The Ratio Test tells us that for any series, if the ratios  $|a_{n+1}/a_n|$  approach a number less than 1 as  $n \rightarrow \infty$ , then the series converges. The proofs of both the Ratio Test and the Root Test involve comparing a series with a geometric series.

### The Ratio Test

The following test is very useful in determining whether a given series is absolutely convergent.

#### The Ratio Test

- (i) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L < 1$ , then the series  $\sum_{n=1}^{\infty} a_n$  is absolutely convergent (and therefore convergent).
- (ii) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L > 1$  or  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \infty$ , then the series  $\sum_{n=1}^{\infty} a_n$  is divergent.
- (iii) If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$ , the Ratio Test is inconclusive; that is, no conclusion can be drawn about the convergence or divergence of  $\sum a_n$ .

#### PROOF

- (i) The idea is to compare the given series with a convergent geometric series. Since  $L < 1$ , we can choose a number  $r$  such that  $L < r < 1$ . Since

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L \quad \text{and} \quad L < r$$

the ratio  $|a_{n+1}/a_n|$  will eventually be less than  $r$ ; that is, there exists an integer  $N$  such that

$$\left| \frac{a_{n+1}}{a_n} \right| < r \quad \text{whenever } n \geq N$$

or, equivalently,

1

$$|a_{n+1}| < |a_n|r \quad \text{whenever } n \geq N$$

Putting  $n$  successively equal to  $N, N + 1, N + 2, \dots$  in (1), we obtain

$$|a_{N+1}| < |a_N|r$$

$$|a_{N+2}| < |a_{N+1}|r < |a_N|r^2$$

$$|a_{N+3}| < |a_{N+2}|r < |a_N|r^3$$

and, in general,

$$\boxed{2} \quad |a_{N+k}| < |a_N|r^k \quad \text{for all } k \geq 1$$

Now the series

$$\sum_{k=1}^{\infty} |a_N|r^k = |a_N|r + |a_N|r^2 + |a_N|r^3 + \dots$$

is convergent because it is a geometric series with  $0 < r < 1$ . So the inequality (2), together with the Direct Comparison Test, shows that the series

$$\sum_{n=N+1}^{\infty} |a_n| = \sum_{k=1}^{\infty} |a_{N+k}| = |a_{N+1}| + |a_{N+2}| + |a_{N+3}| + \dots$$

is also convergent. It follows that the series  $\sum_{n=1}^{\infty} |a_n|$  is convergent. (Recall that a finite number of terms doesn't affect convergence.) Therefore  $\sum a_n$  is absolutely convergent.

(ii) If  $|a_{n+1}/a_n| \rightarrow L > 1$  or  $|a_{n+1}/a_n| \rightarrow \infty$ , then the ratio  $|a_{n+1}/a_n|$  will eventually be greater than 1; that is, there exists an integer  $N$  such that

$$\left| \frac{a_{n+1}}{a_n} \right| > 1 \quad \text{whenever } n \geq N$$

This means that  $|a_{n+1}| > |a_n|$  whenever  $n \geq N$  and so

$$\lim_{n \rightarrow \infty} a_n \neq 0$$

Therefore  $\sum a_n$  diverges by the Test for Divergence. ■

**EXAMPLE 1** Test the series  $\sum_{n=1}^{\infty} (-1)^n \frac{n^3}{3^n}$  for absolute convergence.

**SOLUTION** We use the Ratio Test with  $a_n = (-1)^n n^3/3^n$ :

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{\frac{(-1)^{n+1}(n+1)^3}{3^{n+1}}}{\frac{(-1)^n n^3}{3^n}} \right| = \frac{(n+1)^3}{3^{n+1}} \cdot \frac{3^n}{n^3} \\ &= \frac{1}{3} \left( \frac{n+1}{n} \right)^3 = \frac{1}{3} \left( 1 + \frac{1}{n} \right)^3 \rightarrow \frac{1}{3} < 1 \end{aligned}$$

Thus, by the Ratio Test, the given series is absolutely convergent. ■

**EXAMPLE 2** Test the convergence of the series  $\sum_{n=1}^{\infty} \frac{n^n}{n!}$ .

**SOLUTION** Since the terms  $a_n = n^n/n!$  are positive, we don't need the absolute value signs.

$$\begin{aligned}\frac{a_{n+1}}{a_n} &= \frac{(n+1)^{n+1}}{(n+1)!} \cdot \frac{n!}{n^n} = \frac{(n+1)(n+1)^n}{(n+1)n!} \cdot \frac{n!}{n^n} \\ &= \left(\frac{n+1}{n}\right)^n = \left(1 + \frac{1}{n}\right)^n \rightarrow e \quad \text{as } n \rightarrow \infty\end{aligned}$$

(see Equation 3.6.6). Since  $e > 1$ , the given series is divergent by the Ratio Test. ■

**NOTE** Although the Ratio Test works in Example 2, an easier method is to use the Test for Divergence. Since

$$a_n = \frac{n^n}{n!} = \frac{n \cdot n \cdot n \cdot \dots \cdot n}{1 \cdot 2 \cdot 3 \cdot \dots \cdot n} \geq n$$

it follows that  $a_n$  does not approach 0 as  $n \rightarrow \infty$ . Therefore the given series is divergent by the Test for Divergence.

**EXAMPLE 3** Part (iii) of the Ratio Test says that if  $\lim_{n \rightarrow \infty} |a_{n+1}/a_n| = 1$ , then the test gives no information. For instance, let's apply the Ratio Test to each of the following series:

$$\sum_{n=1}^{\infty} \frac{1}{n} \quad \sum_{n=1}^{\infty} \frac{1}{n^2}$$

In the first series  $a_n = 1/n$  and

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{1/(n+1)}{1/n} = \frac{n}{n+1} \rightarrow 1 \quad \text{as } n \rightarrow \infty$$

In the second series  $a_n = 1/n^2$  and

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{1/(n+1)^2}{1/n^2} = \left( \frac{n}{n+1} \right)^2 \rightarrow 1 \quad \text{as } n \rightarrow \infty$$

The Ratio Test is usually conclusive if the  $n$ th term of the series contains an exponential or a factorial, as in Examples 1 and 2. The test will always fail for  $p$ -series, as in Example 3.

In both cases the Ratio Test fails to determine whether the series converges or diverges, so we must try another test. Here the first series is the harmonic series, which we know diverges; the second series is a  $p$ -series with  $p > 1$ , so it converges. ■

### ■ The Root Test

The following test is convenient to apply when  $n$ th powers occur. Its proof is similar to the proof of the Ratio Test and is left as Exercise 45.

**The Root Test**

- (i) If  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L < 1$ , then the series  $\sum_{n=1}^{\infty} a_n$  is absolutely convergent (and therefore convergent).
- (ii) If  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L > 1$  or  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \infty$ , then the series  $\sum_{n=1}^{\infty} a_n$  is divergent.
- (iii) If  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = 1$ , the Root Test is inconclusive.

If  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = 1$ , then part (iii) of the Root Test says that the test gives no information. The series  $\sum a_n$  could converge or diverge. (If  $L = 1$  in the Ratio Test, don't try the Root Test because  $L$  will again be 1. And if  $L = 1$  in the Root Test, don't try the Ratio Test because it will fail too.)

**EXAMPLE 4** Test the convergence of the series  $\sum_{n=1}^{\infty} \left( \frac{2n+3}{3n+2} \right)^n$ .

**SOLUTION**

$$a_n = \left( \frac{2n+3}{3n+2} \right)^n$$

$$\sqrt[n]{|a_n|} = \sqrt[n]{\frac{2n+3}{3n+2}} = \sqrt[n]{\frac{2 + \frac{3}{n}}{3 + \frac{2}{n}}} \rightarrow \frac{2}{3} < 1$$

Thus the given series is absolutely convergent (and therefore convergent) by the Root Test. ■

**EXAMPLE 5** Determine whether the series  $\sum_{n=1}^{\infty} \left( \frac{n}{n+1} \right)^n$  converges or diverges.

**SOLUTION** Here it seems natural to apply the Root Test:

$$\sqrt[n]{|a_n|} = \sqrt[n]{\frac{n}{n+1}} = \frac{n}{n+1} \rightarrow 1 \quad \text{as } n \rightarrow \infty$$

Since this limit is 1, the Root Test is inconclusive. However, using Equation 3.6.6 we see that

$$a_n = \left( \frac{n}{n+1} \right)^n = \frac{1}{\left( \frac{n+1}{n} \right)^n} = \frac{1}{e} \quad \text{as } n \rightarrow \infty$$

Since this limit is different from zero, the series diverges by the Test for Divergence. ■

Example 5 serves as a reminder that when testing a series for convergence or divergence it is often helpful to apply the Test for Divergence before attempting other tests.

## 11.6 Exercises

1. What can you say about the series  $\sum a_n$  in each of the following cases?

(a)  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 8$

(b)  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 0.8$

(c)  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$

2. Suppose that for the series  $\sum a_n$  we have  $\lim_{n \rightarrow \infty} |a_n/a_{n+1}| = 2$ . What is  $\lim_{n \rightarrow \infty} |a_{n+1}/a_n|$ ? Does the series converge?

**3–20** Use the Ratio Test to determine whether the series is convergent or divergent.

3.  $\sum_{n=1}^{\infty} \frac{n}{5^n}$

4.  $\sum_{n=1}^{\infty} \frac{(-2)^n}{n^2}$

5.  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{3^n}{2^n n^3}$

6.  $\sum_{n=0}^{\infty} \frac{(-3)^n}{(2n+1)!}$

7.  $\sum_{k=1}^{\infty} \frac{1}{k!}$

8.  $\sum_{k=1}^{\infty} k e^{-k}$

9.  $\sum_{n=1}^{\infty} \frac{10^n}{(n+1)4^{2n+1}}$

10.  $\sum_{n=1}^{\infty} \frac{n!}{100^n}$

11.  $\sum_{n=1}^{\infty} \frac{n\pi^n}{(-3)^{n-1}}$

12.  $\sum_{n=1}^{\infty} \frac{n^{10}}{(-10)^{n+1}}$

13.  $\sum_{n=1}^{\infty} \frac{\cos(n\pi/3)}{n!}$

14.  $\sum_{n=1}^{\infty} \frac{n!}{n^n}$

15.  $\sum_{n=1}^{\infty} \frac{n^{100} 100^n}{n!}$

16.  $\sum_{n=1}^{\infty} \frac{(2n)!}{(n!)^2}$

17.  $1 - \frac{2!}{1 \cdot 3} + \frac{3!}{1 \cdot 3 \cdot 5} - \frac{4!}{1 \cdot 3 \cdot 5 \cdot 7} + \dots$   
 $+ (-1)^{n-1} \frac{n!}{1 \cdot 3 \cdot 5 \cdot \dots \cdot (2n-1)} + \dots$

18.  $\frac{2}{3} + \frac{2 \cdot 5}{3 \cdot 5} + \frac{2 \cdot 5 \cdot 8}{3 \cdot 5 \cdot 7} + \frac{2 \cdot 5 \cdot 8 \cdot 11}{3 \cdot 5 \cdot 7 \cdot 9} + \dots$

19.  $\sum_{n=1}^{\infty} \frac{2 \cdot 4 \cdot 6 \cdot \dots \cdot (2n)}{n!}$

20.  $\sum_{n=1}^{\infty} (-1)^n \frac{2^n n!}{5 \cdot 8 \cdot 11 \cdot \dots \cdot (3n+2)}$

- 21–26** Use the Root Test to determine whether the series is convergent or divergent.

21.  $\sum_{n=1}^{\infty} \left( \frac{n^2 + 1}{2n^2 + 1} \right)^n$

22.  $\sum_{n=1}^{\infty} \frac{(-2)^n}{n^n}$

23.  $\sum_{n=2}^{\infty} \frac{(-1)^{n-1}}{(\ln n)^n}$

24.  $\sum_{n=1}^{\infty} \left( \frac{-2n}{n+1} \right)^{5n}$

25.  $\sum_{n=1}^{\infty} \left( 1 + \frac{1}{n} \right)^{n^2}$

26.  $\sum_{n=0}^{\infty} (\arctan n)^n$

- 27–34** Use any test to determine whether the series is absolutely convergent, conditionally convergent, or divergent.

27.  $\sum_{n=2}^{\infty} \frac{(-1)^n \ln n}{n}$

28.  $\sum_{n=1}^{\infty} \left( \frac{1-n}{2+3n} \right)^n$

29.  $\sum_{n=1}^{\infty} \frac{(-9)^n}{n 10^{n+1}}$

30.  $\sum_{n=1}^{\infty} \frac{n 5^{2n}}{10^{n+1}}$

31.  $\sum_{n=2}^{\infty} \left( \frac{n}{\ln n} \right)^n$

32.  $\sum_{n=1}^{\infty} \frac{\sin(n\pi/6)}{1+n\sqrt{n}}$

33.  $\sum_{n=1}^{\infty} \frac{(-1)^n \arctan n}{n^2}$

34.  $\sum_{n=2}^{\infty} \frac{(-1)^n}{\sqrt{n} \ln n}$  [Hint:  $\ln x < \sqrt{x}$ .]

35. The terms of a series are defined recursively by the equations

$$a_1 = 2 \quad a_{n+1} = \frac{5n+1}{4n+3} a_n$$

Determine whether  $\sum a_n$  converges or diverges.

36. A series  $\sum a_n$  is defined by the equations

$$a_1 = 1 \quad a_{n+1} = \frac{2 + \cos n}{\sqrt{n}} a_n$$

Determine whether  $\sum a_n$  converges or diverges.

- 37–38** Let  $\{b_n\}$  be a sequence of positive numbers that converges to  $\frac{1}{2}$ . Determine whether the given series is absolutely convergent.

37.  $\sum_{n=1}^{\infty} \frac{b_n^n \cos n\pi}{n}$

38.  $\sum_{n=1}^{\infty} \frac{(-1)^n n!}{n^n b_1 b_2 b_3 \dots b_n}$

39. For which of the following series is the Ratio Test inconclusive (that is, it fails to give a definite answer)?

(a)  $\sum_{n=1}^{\infty} \frac{1}{n^3}$

(b)  $\sum_{n=1}^{\infty} \frac{n}{2^n}$

(c)  $\sum_{n=1}^{\infty} \frac{(-3)^{n-1}}{\sqrt{n}}$

(d)  $\sum_{n=1}^{\infty} \frac{\sqrt{n}}{1+n^2}$

40. For which positive integers  $k$  is the following series convergent?

$$\sum_{n=1}^{\infty} \frac{(n!)^2}{(kn)!}$$

41. (a) Show that  $\sum_{n=0}^{\infty} x^n/n!$  converges for all  $x$ .  
 (b) Deduce that  $\lim_{n \rightarrow \infty} x^n/n! = 0$  for all  $x$ .

42. Let  $\sum a_n$  be a series with positive terms and let  $r_n = a_{n+1}/a_n$ . Suppose that  $\lim_{n \rightarrow \infty} r_n = L < 1$ , so  $\sum a_n$  converges by the Ratio Test. As usual, we let  $R_n$  be the remainder after  $n$  terms, that is,

$$R_n = a_{n+1} + a_{n+2} + a_{n+3} + \dots$$

- (a) If  $\{r_n\}$  is a decreasing sequence and  $r_{n+1} < 1$ , show, by summing a geometric series, that

$$R_n \leq \frac{a_{n+1}}{1 - r_{n+1}}$$

- (b) If  $\{r_n\}$  is an increasing sequence, show that

$$R_n \leq \frac{a_{n+1}}{1 - L}$$

43. (a) Find the partial sum  $s_5$  of the series  $\sum_{n=1}^{\infty} 1/(n2^n)$ . Use Exercise 42 to estimate the error in using  $s_5$  as an approximation to the sum of the series.

- (b) Find a value of  $n$  so that  $s_n$  is within 0.00005 of the sum. Use this value of  $n$  to approximate the sum of the series.

44. Use the sum of the first 10 terms to approximate the sum of the series

$$\sum_{n=1}^{\infty} \frac{n}{2^n}$$

Use Exercise 42 to estimate the error.

45. Prove the Root Test. [Hint for part (i): Take any number  $r$  such that  $L < r < 1$  and use the fact that there is an integer  $N$  such that  $\sqrt[n]{|a_n|} < r$  whenever  $n \geq N$ .]

46. Around 1910, the Indian mathematician Srinivasa Ramanujan discovered the formula

$$\frac{1}{\pi} = \frac{2\sqrt{2}}{9801} \sum_{n=0}^{\infty} \frac{(4n)!(1103 + 26390n)}{(n!)^4 396^{4n}}$$

William Gosper used this series in 1985 to compute the first 17 million digits of  $\pi$ .

- (a) Verify that the series is convergent.  
 (b) How many correct decimal places of  $\pi$  do you get if you use just the first term of the series? What if you use two terms?

## 11.7

## Strategy for Testing Series

We now have several ways of testing a series for convergence or divergence; the problem is to decide which test to use on which series. In this respect, testing series is similar to integrating functions. Again, there are no hard and fast rules about which test to apply to a given series, but you may find the following advice of some use.

It is not wise to apply a list of the tests in a specific order until one finally works. That would be a waste of time and effort. Instead, as with integration, the main strategy is to classify the series according to its *form*.

- Test for Divergence** If you can see that  $\lim_{n \rightarrow \infty} a_n$  may be different from 0, then apply the Test for Divergence.
- $p$ -Series** If the series is of the form  $\sum 1/n^p$ , then it is a  $p$ -series, which we know to be convergent if  $p > 1$  and divergent if  $p \leq 1$ .
- Geometric Series** If the series has the form  $\sum ar^{n-1}$  or  $\sum ar^n$ , then it is a geometric series, which converges if  $|r| < 1$  and diverges if  $|r| \geq 1$ . Some preliminary algebraic manipulation may be required to bring the series into this form.
- Comparison Tests** If the series has a form that is similar to a  $p$ -series or a geometric series, then one of the comparison tests should be considered. In particular, if  $a_n$  is a rational function or an algebraic function of  $n$  (involving roots of polynomials), then the series should be compared with a  $p$ -series. Notice that most of the series in Exercises 11.4 have this form. (The value of  $p$  should be chosen as in Section 11.4 by keeping only the highest powers of  $n$  in the numerator and denominator.) The comparison tests apply only to series with positive terms, but if  $\sum a_n$  has some negative terms, then we can apply a comparison test to  $\sum |a_n|$  and test for absolute convergence.

5. **Alternating Series Test** If the series is of the form  $\sum (-1)^{n-1} b_n$  or  $\sum (-1)^n b_n$ , then the Alternating Series Test is an obvious possibility. Note that if  $\sum b_n$  converges, then the given series is absolutely convergent and therefore convergent.
6. **Ratio Test** Series that involve factorials or other products (including a constant raised to the  $n$ th power) are often conveniently tested using the Ratio Test. Bear in mind that  $|a_{n+1}/a_n| \rightarrow 1$  as  $n \rightarrow \infty$  for all  $p$ -series and therefore all rational or algebraic functions of  $n$ . Thus the Ratio Test should not be used for such series.
7. **Root Test** If  $a_n$  is of the form  $(b_n)^n$ , then the Root Test may be useful.
8. **Integral Test** If  $a_n = f(n)$ , where  $\int_1^\infty f(x) dx$  is easily evaluated, then the Integral Test is effective (assuming the hypotheses of this test are satisfied).

In the following examples we don't work out all the details but simply indicate which tests should be used.

**EXAMPLE 1** 
$$\sum_{n=1}^{\infty} \frac{n-1}{2n+1}$$

Since  $a_n \rightarrow \frac{1}{2} \neq 0$  as  $n \rightarrow \infty$ , we should use the Test for Divergence. ■

**EXAMPLE 2** 
$$\sum_{n=1}^{\infty} \frac{\sqrt{n^3 + 1}}{3n^3 + 4n^2 + 2}$$

Since  $a_n$  is an algebraic function of  $n$ , we compare the given series with a  $p$ -series. The comparison series for the Limit Comparison Test is  $\sum b_n$ , where

$$b_n = \frac{\sqrt{n^3}}{3n^3} = \frac{n^{3/2}}{3n^3} = \frac{1}{3n^{3/2}}$$

**EXAMPLE 3** 
$$\sum_{n=1}^{\infty} n e^{-n^2}$$

Since the integral  $\int_1^\infty x e^{-x^2} dx$  is easily evaluated, we use the Integral Test. The Ratio Test also works. ■

**EXAMPLE 4** 
$$\sum_{n=1}^{\infty} (-1)^n \frac{n^2}{n^4 + 1}$$

Since the series is alternating, we use the Alternating Series Test. We can also observe that  $\sum |a_n|$  converges (compare to  $\sum 1/n^2$ ) so the given series converges absolutely and hence converges. ■

**EXAMPLE 5** 
$$\sum_{k=1}^{\infty} \frac{2^k}{k!}$$

Since the series involves  $k!$ , we use the Ratio Test. ■

**EXAMPLE 6** 
$$\sum_{n=1}^{\infty} \frac{1}{2 + 3^n}$$

Since the series is closely related to the geometric series  $\sum 1/3^n$ , we use the Direct Comparison Test or the Limit Comparison Test. ■

## 11.7 | Exercises

**1–8** Two similar-looking series are given. Test each one for convergence or divergence.

1. (a)  $\sum_{n=1}^{\infty} \frac{1}{5^n}$

(b)  $\sum_{n=1}^{\infty} \frac{1}{5^n + n}$

2. (a)  $\sum_{n=1}^{\infty} \frac{(-1)^n}{n^{3/2}}$

(b)  $\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$

3. (a)  $\sum_{n=1}^{\infty} \frac{n}{3^n}$

(b)  $\sum_{n=1}^{\infty} \frac{3^n}{n}$

4. (a)  $\sum_{n=1}^{\infty} \frac{n+1}{n}$

(b)  $\sum_{n=1}^{\infty} (-1)^n \frac{n+1}{n}$

5. (a)  $\sum_{n=1}^{\infty} \frac{n}{n^2 + 1}$

(b)  $\sum_{n=1}^{\infty} \left( \frac{n}{n^2 + 1} \right)^n$

6. (a)  $\sum_{n=1}^{\infty} \frac{\ln n}{n}$

(b)  $\sum_{n=10}^{\infty} \frac{1}{n \ln n}$

7. (a)  $\sum_{n=1}^{\infty} \frac{1}{n+n!}$

(b)  $\sum_{n=1}^{\infty} \left( \frac{1}{n} + \frac{1}{n!} \right)$

8. (a)  $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^2 + 1}}$

(b)  $\sum_{n=1}^{\infty} \frac{1}{n\sqrt{n^2 + 1}}$

**9–48** Test the series for convergence or divergence.

9.  $\sum_{n=1}^{\infty} \frac{n^2 - 1}{n^3 + 1}$

10.  $\sum_{n=1}^{\infty} \frac{n - 1}{n^3 + 1}$

11.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2 - 1}{n^3 + 1}$

12.  $\sum_{n=1}^{\infty} (-1)^n \frac{n^2 - 1}{n^2 + 1}$

13.  $\sum_{n=1}^{\infty} \frac{e^n}{n^2}$

14.  $\sum_{n=1}^{\infty} \frac{n^{2n}}{(1+n)^{3n}}$

15.  $\sum_{n=2}^{\infty} \frac{1}{n\sqrt{\ln n}}$

16.  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{n^4}{4^n}$

17.  $\sum_{n=0}^{\infty} (-1)^n \frac{\pi^{2n}}{(2n)!}$

18.  $\sum_{n=1}^{\infty} n^2 e^{-n^3}$

19.  $\sum_{n=1}^{\infty} \left( \frac{1}{n^3} + \frac{1}{3^n} \right)$

20.  $\sum_{k=1}^{\infty} \frac{1}{k\sqrt{k^2 + 1}}$

21.  $\sum_{n=1}^{\infty} \frac{3^n n^2}{n!}$

22.  $\sum_{n=1}^{\infty} \frac{\sin 2n}{1 + 2^n}$

23.  $\sum_{k=1}^{\infty} \frac{2^{k-1} 3^{k+1}}{k^k}$

24.  $\sum_{n=1}^{\infty} \frac{\sqrt{n^4 + 1}}{n^3 + n}$

25.  $\sum_{n=1}^{\infty} \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 5 \cdot 8 \cdots (3n-1)}$

26.  $\sum_{n=2}^{\infty} \frac{(-1)^{n-1}}{\sqrt{n} - 1}$

27.  $\sum_{n=1}^{\infty} (-1)^n \frac{\ln n}{\sqrt{n}}$

28.  $\sum_{k=1}^{\infty} \frac{\sqrt[3]{k} - 1}{k(\sqrt[3]{k} + 1)}$

29.  $\sum_{n=1}^{\infty} (-1)^n \cos(1/n^2)$

30.  $\sum_{k=1}^{\infty} \frac{1}{2 + \sin k}$

31.  $\sum_{n=1}^{\infty} \tan(1/n)$

32.  $\sum_{n=1}^{\infty} n \sin(1/n)$

33.  $\sum_{n=1}^{\infty} \frac{4 - \cos n}{\sqrt{n}}$

34.  $\sum_{n=1}^{\infty} \frac{8 + (-1)^n n}{n}$

35.  $\sum_{n=1}^{\infty} \frac{n!}{e^{n^2}}$

36.  $\sum_{n=1}^{\infty} \frac{n^2 + 1}{5^n}$

37.  $\sum_{k=1}^{\infty} \frac{k \ln k}{(k+1)^3}$

38.  $\sum_{n=1}^{\infty} \frac{e^{1/n}}{n^2}$

39.  $\sum_{n=1}^{\infty} \frac{(-1)^n}{\cosh n}$

40.  $\sum_{j=1}^{\infty} (-1)^j \frac{\sqrt{j}}{j+5}$

41.  $\sum_{k=1}^{\infty} \frac{5^k}{3^k + 4^k}$

42.  $\sum_{n=1}^{\infty} \frac{(n!)^n}{n^{4n}}$

43.  $\sum_{n=1}^{\infty} \left( \frac{n}{n+1} \right)^{n^2}$

44.  $\sum_{n=1}^{\infty} \frac{1}{n + n \cos^2 n}$

45.  $\sum_{n=1}^{\infty} \frac{1}{n^{1+1/n}}$

46.  $\sum_{n=2}^{\infty} \frac{1}{(\ln n)^{\ln n}}$

47.  $\sum_{n=1}^{\infty} (\sqrt[n]{2} - 1)^n$

48.  $\sum_{n=1}^{\infty} (\sqrt[n]{2} - 1)$

## 11.8 | Power Series

So far we have studied series of numbers:  $\sum a_n$ . Here we consider series, called *power series*, in which each term includes a power of the variable  $x$ :  $\sum c_n x^n$ .

### ■ Power Series

A **power series** is a series of the form

1

$$\sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 x + c_2 x^2 + c_3 x^3 + \dots$$

**Trigonometric Series**

A power series is a series in which each term is a power function. A **trigonometric series**

$$\sum_{n=0}^{\infty} (a_n \cos nx + b_n \sin nx)$$

is a series whose terms are trigonometric functions. This type of series is discussed on the website

[www.StewartCalculus.com](http://www.StewartCalculus.com)

Click on *Additional Topics* and then on *Fourier Series*.

where  $x$  is a variable and the  $c_n$ 's are constants called the **coefficients** of the series. For each number that we substitute for  $x$ , the series (1) is a series of constants that we can test for convergence or divergence. A power series may converge for some values of  $x$  and diverge for other values of  $x$ . The sum of the series is a function

$$f(x) = c_0 + c_1 x + c_2 x^2 + \cdots + c_n x^n + \cdots$$

whose domain is the set of all  $x$  for which the series converges. Notice that  $f$  resembles a polynomial. The only difference is that  $f$  has infinitely many terms.

For instance, if we take  $c_n = 1$  for all  $n$ , the power series becomes the geometric series

2  $\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + \cdots + x^n + \cdots$

which converges when  $-1 < x < 1$  and diverges when  $|x| \geq 1$ . (See Equation 11.2.5.) In fact if we put  $x = \frac{1}{2}$  in the geometric series (2) we get the convergent series

$$\sum_{n=0}^{\infty} \left(\frac{1}{2}\right)^n = 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots$$

but if we put  $x = 2$  in (2) we get the divergent series

$$\sum_{n=0}^{\infty} 2^n = 1 + 2 + 4 + 8 + 16 + \cdots$$

More generally, a series of the form

3  $\sum_{n=0}^{\infty} c_n(x - a)^n = c_0 + c_1(x - a) + c_2(x - a)^2 + \cdots$

is called a **power series in  $(x - a)$**  or a **power series centered at  $a$**  or a **power series about  $a$** . Notice that in writing out the term corresponding to  $n = 0$  in Equations 1 and 3 we have adopted the convention that  $(x - a)^0 = 1$  even when  $x = a$ . Notice also that when  $x = a$ , all of the terms are 0 for  $n \geq 1$  and so the power series (3) always converges when  $x = a$ .

To determine the values of  $x$  for which a power series converges, we normally use the Ratio (or Root) Test.

**EXAMPLE 1** For what values of  $x$  does the series  $\sum_{n=1}^{\infty} \frac{(x - 3)^n}{n}$  converge?

**SOLUTION** If we let  $a_n$  denote the  $n$ th term of the series, as usual, then  $a_n = (x - 3)^n/n$ , and

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{(x - 3)^{n+1}}{n + 1} \cdot \frac{n}{(x - 3)^n} \right| \\ &= \frac{1}{1 + \frac{1}{n}} |x - 3| \rightarrow |x - 3| \quad \text{as } n \rightarrow \infty \end{aligned}$$

By the Ratio Test, the given series is absolutely convergent, and therefore convergent, when  $|x - 3| < 1$  and divergent when  $|x - 3| > 1$ . Now

$$|x - 3| < 1 \iff -1 < x - 3 < 1 \iff 2 < x < 4$$

so the series converges when  $2 < x < 4$  and diverges when  $x < 2$  or  $x > 4$ .

The Ratio Test gives no information when  $|x - 3| = 1$  so we must consider  $x = 2$  and  $x = 4$  separately. If we put  $x = 4$  in the series, it becomes  $\sum 1/n$ , the harmonic series, which is divergent. If  $x = 2$ , the series is  $\sum (-1)^n/n$ , which converges by the Alternating Series Test. Thus the given power series converges for  $2 \leq x < 4$ . ■

**EXAMPLE 2** For what values of  $x$  is the series  $\sum_{n=0}^{\infty} n!x^n$  convergent?

**SOLUTION** Again we use the Ratio Test. Let  $a_n = n!x^n$ . If  $x \neq 0$ , we have

Notice that

$$(n+1)! = (n+1)n(n-1) \cdots 3 \cdot 2 \cdot 1 \\ = (n+1)n!$$

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)!x^{n+1}}{n!x^n} \right| = \lim_{n \rightarrow \infty} (n+1)|x| = \infty$$

By the Ratio Test, the series diverges when  $x \neq 0$ . Thus the given series converges only when  $x = 0$ . ■

**EXAMPLE 3** For what values of  $x$  does the series  $\sum_{n=0}^{\infty} \frac{x^n}{(2n)!}$  converge?

**SOLUTION** Here  $a_n = x^n/(2n)!$  and, as  $n \rightarrow \infty$ ,

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{x^{n+1}}{[2(n+1)]!} \cdot \frac{(2n)!}{x^n} \right| = \frac{(2n)!}{(2n+2)!} |x| \\ &= \frac{(2n)!}{(2n)!(2n+1)(2n+2)} |x| = \frac{|x|}{(2n+1)(2n+2)} \rightarrow 0 < 1 \end{aligned}$$

for all  $x$ . Thus, by the Ratio Test, the given series converges for all values of  $x$ . ■

### ■ Interval of Convergence

For the power series that we have looked at so far, the set of values of  $x$  for which the series is convergent has always turned out to be an interval [a finite interval for the geometric series and the series in Example 1, the infinite interval  $(-\infty, \infty)$  in Example 3, and a collapsed interval  $[0, 0] = \{0\}$  in Example 2]. The following theorem, proved in Appendix F, says that this is true in general.

**4 Theorem** For a power series  $\sum_{n=0}^{\infty} c_n(x - a)^n$ , there are only three possibilities:

- (i) The series converges only when  $x = a$ .
- (ii) The series converges for all  $x$ .
- (iii) There is a positive number  $R$  such that the series converges if  $|x - a| < R$  and diverges if  $|x - a| > R$ .

The number  $R$  in case (iii) is called the **radius of convergence** of the power series. By convention, the radius of convergence is  $R = 0$  in case (i) and  $R = \infty$  in case (ii). The **interval of convergence** of a power series is the interval that consists of all values of  $x$  for which the series converges. In case (i) the interval consists of just a single point  $a$ . In case (ii) the interval is  $(-\infty, \infty)$ . In case (iii) note that the inequality  $|x - a| < R$  can be rewritten as  $a - R < x < a + R$ . When  $x$  is an *endpoint* of the interval, that is,

$x = a \pm R$ , anything can happen—the series might converge at one or both endpoints or it might diverge at both endpoints. Thus in case (iii) there are four possibilities for the interval of convergence:

$$(a - R, a + R) \quad (a - R, a + R] \quad [a - R, a + R) \quad [a - R, a + R]$$

The situation is illustrated in Figure 1.

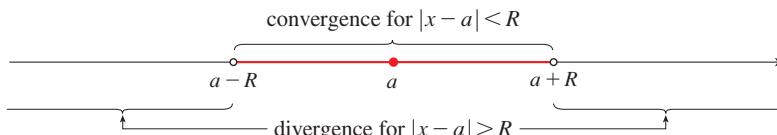

FIGURE 1

We summarize here the radius and interval of convergence for each of the examples already considered in this section.

	Series	Radius of convergence	Interval of convergence
Geometric series	$\sum_{n=0}^{\infty} x^n$	$R = 1$	$(-1, 1)$
Example 1	$\sum_{n=1}^{\infty} \frac{(x-3)^n}{n}$	$R = 1$	$[2, 4)$
Example 2	$\sum_{n=0}^{\infty} n! x^n$	$R = 0$	$\{0\}$
Example 3	$\sum_{n=0}^{\infty} \frac{x^n}{(2n)!}$	$R = \infty$	$(-\infty, \infty)$

**NOTE** In general, the Ratio Test (or sometimes the Root Test) should be used to determine the radius of convergence  $R$ . The Ratio and Root Tests always fail when  $x$  is an endpoint of the interval of convergence, so the endpoints must be checked with some other test.

**EXAMPLE 4** Find the radius of convergence and interval of convergence of the series

$$\sum_{n=0}^{\infty} \frac{(-3)^n x^n}{\sqrt{n+1}}$$

**SOLUTION** Let  $a_n = (-3)^n x^n / \sqrt{n+1}$ . Then

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{(-3)^{n+1} x^{n+1}}{\sqrt{n+2}} \cdot \frac{\sqrt{n+1}}{(-3)^n x^n} \right| = \left| -3x \sqrt{\frac{n+1}{n+2}} \right| \\ &= 3 \sqrt{\frac{1+(1/n)}{1+(2/n)}} |x| \rightarrow 3|x| \quad \text{as } n \rightarrow \infty \end{aligned}$$

By the Ratio Test, the given series converges if  $3|x| < 1$  and diverges if  $3|x| > 1$ . Thus it converges if  $|x| < \frac{1}{3}$  and diverges if  $|x| > \frac{1}{3}$ . This means that the radius of convergence is  $R = \frac{1}{3}$ .

We know the series converges in the interval  $(-\frac{1}{3}, \frac{1}{3})$ , but we must now test for convergence at the endpoints of this interval. If  $x = -\frac{1}{3}$ , the series becomes

$$\sum_{n=0}^{\infty} \frac{(-3)^n \left(-\frac{1}{3}\right)^n}{\sqrt{n+1}} = \sum_{n=0}^{\infty} \frac{1}{\sqrt{n+1}} = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \dots$$

which diverges. (It is a  $p$ -series with  $p = \frac{1}{2} < 1$ .) If  $x = \frac{1}{3}$ , the series is

$$\sum_{n=0}^{\infty} \frac{(-3)^n \left(\frac{1}{3}\right)^n}{\sqrt{n+1}} = \sum_{n=0}^{\infty} \frac{(-1)^n}{\sqrt{n+1}}$$

which converges by the Alternating Series Test. Therefore the given power series converges when  $-\frac{1}{3} < x \leq \frac{1}{3}$ , so the interval of convergence is  $(-\frac{1}{3}, \frac{1}{3}]$ . ■

**EXAMPLE 5** Find the radius of convergence and interval of convergence of the series

$$\sum_{n=0}^{\infty} \frac{n(x+2)^n}{3^{n+1}}$$

**SOLUTION** If  $a_n = n(x+2)^n/3^{n+1}$ , then

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{(n+1)(x+2)^{n+1}}{3^{n+2}} \cdot \frac{3^{n+1}}{n(x+2)^n} \right| \\ &= \left( 1 + \frac{1}{n} \right) \frac{|x+2|}{3} \rightarrow \frac{|x+2|}{3} \quad \text{as } n \rightarrow \infty \end{aligned}$$

Using the Ratio Test, we see that the series converges if  $|x+2|/3 < 1$  and it diverges if  $|x+2|/3 > 1$ . So it converges if  $|x+2| < 3$  and diverges if  $|x+2| > 3$ . Thus the radius of convergence is  $R = 3$ .

The inequality  $|x+2| < 3$  can be written as  $-5 < x < 1$ , so we test the series at the endpoints  $-5$  and  $1$ . When  $x = -5$ , the series is

$$\sum_{n=0}^{\infty} \frac{n(-3)^n}{3^{n+1}} = \frac{1}{3} \sum_{n=0}^{\infty} (-1)^n n$$

which diverges by the Test for Divergence [ $(-1)^n n$  doesn't converge to 0]. When  $x = 1$ , the series is

$$\sum_{n=0}^{\infty} \frac{n(3)^n}{3^{n+1}} = \frac{1}{3} \sum_{n=0}^{\infty} n$$

which also diverges by the Test for Divergence. Thus the series converges only when  $-5 < x < 1$ , so the interval of convergence is  $(-5, 1)$ . ■

## 11.8 Exercises

1. What is a power series?

2. (a) What is the radius of convergence of a power series?  
How do you find it?  
(b) What is the interval of convergence of a power series?  
How do you find it?

**3–36** Find the radius of convergence and interval of convergence of the power series.

3.  $\sum_{n=1}^{\infty} \frac{x^n}{n}$

5.  $\sum_{n=1}^{\infty} \sqrt{n} x^n$

7.  $\sum_{n=1}^{\infty} \frac{n}{5^n} x^n$

9.  $\sum_{n=1}^{\infty} \frac{x^n}{n3^n}$

11.  $\sum_{n=1}^{\infty} \frac{x^n}{2n-1}$

13.  $\sum_{n=0}^{\infty} \frac{x^n}{n!}$

15.  $\sum_{n=1}^{\infty} \frac{x^n}{n^4 4^n}$

17.  $\sum_{n=1}^{\infty} \frac{(-1)^n 4^n}{\sqrt{n}} x^n$

19.  $\sum_{n=1}^{\infty} \frac{n}{2^n(n^2+1)} x^n$

21.  $\sum_{n=0}^{\infty} \frac{(x-2)^n}{n^2+1}$

23.  $\sum_{n=2}^{\infty} \frac{(x+2)^n}{2^n \ln n}$

25.  $\sum_{n=1}^{\infty} \frac{(x-2)^n}{n^n}$

27.  $\sum_{n=4}^{\infty} \frac{\ln n}{n} x^n$

29.  $\sum_{n=1}^{\infty} \frac{n}{b^n} (x-a)^n, \quad b > 0$

30.  $\sum_{n=2}^{\infty} \frac{b^n}{\ln n} (x-a)^n, \quad b > 0$

31.  $\sum_{n=1}^{\infty} n!(2x-1)^n$

4.  $\sum_{n=1}^{\infty} (-1)^n nx^n$

6.  $\sum_{n=1}^{\infty} \frac{(-1)^n x^n}{\sqrt[3]{n}}$

8.  $\sum_{n=2}^{\infty} \frac{5^n}{n} x^n$

10.  $\sum_{n=1}^{\infty} \frac{n}{n+1} x^n$

12.  $\sum_{n=1}^{\infty} \frac{(-1)^n x^n}{n^2}$

14.  $\sum_{n=1}^{\infty} n^n x^n$

16.  $\sum_{n=1}^{\infty} 2^n n^2 x^n$

18.  $\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n5^n} x^n$

20.  $\sum_{n=1}^{\infty} \frac{x^{2n}}{n!}$

22.  $\sum_{n=1}^{\infty} \frac{(-1)^n}{(2n-1)2^n} (x-1)^n$

24.  $\sum_{n=1}^{\infty} \frac{\sqrt{n}}{8^n} (x+6)^n$

26.  $\sum_{n=1}^{\infty} \frac{(2x-1)^n}{5^n \sqrt{n}}$

28.  $\sum_{n=2}^{\infty} \frac{(-1)^n}{n \ln n} x^n$

33.  $\sum_{n=1}^{\infty} \frac{(5x-4)^n}{n^3}$

34.  $\sum_{n=2}^{\infty} \frac{x^{2n}}{n(\ln n)^2}$

35.  $\sum_{n=1}^{\infty} \frac{x^n}{1 \cdot 3 \cdot 5 \cdots (2n-1)}$

36.  $\sum_{n=1}^{\infty} \frac{n! x^n}{1 \cdot 3 \cdot 5 \cdots (2n-1)}$

**37.** If  $\sum_{n=0}^{\infty} c_n 4^n$  is convergent, can we conclude that each of the following series is convergent?

(a)  $\sum_{n=0}^{\infty} c_n (-2)^n$

(b)  $\sum_{n=0}^{\infty} c_n (-4)^n$

**38.** Suppose that  $\sum_{n=0}^{\infty} c_n x^n$  converges when  $x = -4$  and diverges when  $x = 6$ . What can be said about the convergence or divergence of the following series?

(a)  $\sum_{n=0}^{\infty} c_n$

(b)  $\sum_{n=0}^{\infty} c_n 8^n$

(c)  $\sum_{n=0}^{\infty} c_n (-3)^n$

(d)  $\sum_{n=0}^{\infty} (-1)^n c_n 9^n$

**39.** If  $k$  is a positive integer, find the radius of convergence of the series

$$\sum_{n=0}^{\infty} \frac{(n!)^k}{(kn)!} x^n$$

**40.** Let  $p$  and  $q$  be real numbers with  $p < q$ . Find a power series whose interval of convergence is

- (a)  $(p, q)$       (b)  $(p, q]$       (c)  $[p, q)$       (d)  $[p, q]$

**41.** Is it possible to find a power series whose interval of convergence is  $[0, \infty)$ ? Explain.

 **42.** Graph the first several partial sums  $s_n(x)$  of the series  $\sum_{n=0}^{\infty} x^n$ , together with the sum function  $f(x) = 1/(1-x)$ , on a common screen. On what interval do these partial sums appear to be converging to  $f(x)$ ?

**43.** Show that if  $\lim_{n \rightarrow \infty} \sqrt[n]{|c_n|} = c$ , where  $c \neq 0$ , then the radius of convergence of the power series  $\sum c_n x^n$  is  $R = 1/c$ .

**44.** Suppose that the power series  $\sum c_n (x-a)^n$  satisfies  $c_n \neq 0$  for all  $n$ . Show that if  $\lim_{n \rightarrow \infty} |c_n/c_{n+1}|$  exists, then it is equal to the radius of convergence of the power series.

**45.** Suppose the series  $\sum c_n x^n$  has radius of convergence 2 and the series  $\sum d_n x^n$  has radius of convergence 3. What is the radius of convergence of the series  $\sum (c_n + d_n) x^n$ ?

**46.** Suppose that the radius of convergence of the power series  $\sum c_n x^n$  is  $R$ . What is the radius of convergence of the power series  $\sum c_n x^{2n}$ ?

## 11.9 | Representations of Functions as Power Series

In this section we learn how to represent some familiar functions as sums of power series. You might wonder why we would ever want to express a known function as a sum of infinitely many terms. We will see later that this strategy is useful for integrating functions that don't have elementary antiderivatives and for approximating functions by polynomials. (Scientists do this to simplify the expressions they deal with; computer scientists do this to evaluate functions on calculators and computers.)

### ■ Representations of Functions using Geometric Series

We will obtain power series representations for several functions by manipulating geometric series. We start with an equation that we have seen before.

$$\boxed{1} \quad \frac{1}{1-x} = 1 + x + x^2 + x^3 + \dots = \sum_{n=0}^{\infty} x^n \quad |x| < 1$$

We first encountered this equation in Example 11.2.7, where we obtained it by observing that the series is a geometric series with  $a = 1$  and  $r = x$ . Here our point of view is different: we now regard Equation 1 as expressing the function  $f(x) = 1/(1-x)$  as a sum of a power series. We say that  $\sum_{n=0}^{\infty} x^n$ ,  $|x| < 1$ , is a *power series representation* of  $1/(1-x)$  on the interval  $(-1, 1)$ .

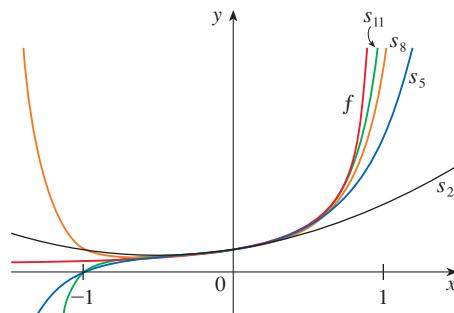

A geometric illustration of Equation 1 is shown in Figure 1. Because the sum of a series is the limit of the sequence of partial sums, we have

$$\frac{1}{1-x} = \lim_{n \rightarrow \infty} s_n(x)$$

where

$$s_n(x) = 1 + x + x^2 + \dots + x^n$$

is the  $n$ th partial sum. Notice that as  $n$  increases,  $s_n(x)$  becomes a better approximation to  $f(x)$  for  $-1 < x < 1$ .

**FIGURE 1**  
 $f(x) = \frac{1}{1-x}$  and some  
of its partial sums

The power series (1) that represents the function  $f(x) = 1/(1-x)$  can be used to obtain power series representations of many other functions, as we see in the following examples.

**EXAMPLE 1** Express  $1/(1 + x^2)$  as the sum of a power series and find the interval of convergence.

**SOLUTION** Replacing  $x$  by  $-x^2$  in Equation 1, we have

$$\begin{aligned}\frac{1}{1 + x^2} &= \frac{1}{1 - (-x^2)} = \sum_{n=0}^{\infty} (-x^2)^n \\ &= \sum_{n=0}^{\infty} (-1)^n x^{2n} = 1 - x^2 + x^4 - x^6 + x^8 - \dots\end{aligned}$$

Because this is a geometric series, it converges when  $|-x^2| < 1$ , that is,  $x^2 < 1$ , or  $|x| < 1$ . Therefore the interval of convergence is  $(-1, 1)$ . (Of course, we could have determined the radius of convergence by applying the Ratio Test, but that much work is unnecessary here.) ■

**EXAMPLE 2** Find a power series representation for  $1/(x + 2)$ .

**SOLUTION** In order to put this function in the form of the left side of Equation 1, we first factor a 2 from the denominator:

$$\begin{aligned}\frac{1}{2 + x} &= \frac{1}{2\left(1 + \frac{x}{2}\right)} = \frac{1}{2\left[1 - \left(-\frac{x}{2}\right)\right]} \\ &= \frac{1}{2} \sum_{n=0}^{\infty} \left(-\frac{x}{2}\right)^n = \sum_{n=0}^{\infty} \frac{(-1)^n}{2^{n+1}} x^n\end{aligned}$$

This series converges when  $|-x/2| < 1$ , that is,  $|x| < 2$ . So the interval of convergence is  $(-2, 2)$ . ■

**EXAMPLE 3** Find a power series representation of  $x^3/(x + 2)$ .

**SOLUTION** Since this function is just  $x^3$  times the function in Example 2, all we have to do is to multiply that series by  $x^3$ :

$$\begin{aligned}\frac{x^3}{x + 2} &= x^3 \cdot \frac{1}{x + 2} = x^3 \sum_{n=0}^{\infty} \frac{(-1)^n}{2^{n+1}} x^n = \sum_{n=0}^{\infty} \frac{(-1)^n}{2^{n+1}} x^{n+3} \\ &= \frac{1}{2}x^3 - \frac{1}{4}x^4 + \frac{1}{8}x^5 - \frac{1}{16}x^6 + \dots\end{aligned}$$

Another way of writing this series is as follows:

$$\frac{x^3}{x + 2} = \sum_{n=3}^{\infty} \frac{(-1)^{n-1}}{2^{n-2}} x^n$$

As in Example 2, the interval of convergence is  $(-2, 2)$ . ■

### Differentiation and Integration of Power Series

The sum of a power series is a function  $f(x) = \sum_{n=0}^{\infty} c_n(x - a)^n$  whose domain is the interval of convergence of the series. We would like to be able to differentiate and integrate such functions, and the following theorem (which we won't prove) says that we can do so by differentiating or integrating each individual term in the series, just as we would for a polynomial. This is called **term-by-term differentiation and integration**.

**2 Theorem** If the power series  $\sum c_n(x - a)^n$  has radius of convergence  $R > 0$ , then the function  $f$  defined by

$$f(x) = c_0 + c_1(x - a) + c_2(x - a)^2 + \dots = \sum_{n=0}^{\infty} c_n(x - a)^n$$

is differentiable (and therefore continuous) on the interval  $(a - R, a + R)$  and

In part (i), the sum starts at  $n = 1$  because the derivative of  $c_0$ , the constant term of  $f$ , is 0.

In part (ii),  $\int c_0 dx = c_0 x + C_1$  is written as  $c_0(x - a) + C$ , where  $C = C_1 + ac_0$ , so all the terms of the series have the same form.

$$(i) f'(x) = c_1 + 2c_2(x - a) + 3c_3(x - a)^2 + \dots = \sum_{n=1}^{\infty} nc_n(x - a)^{n-1}$$

$$\begin{aligned} (ii) \int f(x) dx &= C + c_0(x - a) + c_1 \frac{(x - a)^2}{2} + c_2 \frac{(x - a)^3}{3} + \dots \\ &= C + \sum_{n=0}^{\infty} c_n \frac{(x - a)^{n+1}}{n + 1} \end{aligned}$$

The radii of convergence of the power series in Equations (i) and (ii) are both  $R$ .

**NOTE 1** Equations (i) and (ii) in Theorem 2 can be rewritten in the form

$$(iii) \frac{d}{dx} \left[ \sum_{n=0}^{\infty} c_n(x - a)^n \right] = \sum_{n=0}^{\infty} \frac{d}{dx} [c_n(x - a)^n]$$

$$(iv) \int \left[ \sum_{n=0}^{\infty} c_n(x - a)^n \right] dx = \sum_{n=0}^{\infty} \int c_n(x - a)^n dx$$

We know that, for finite sums, the derivative of a sum is the sum of the derivatives and the integral of a sum is the sum of the integrals. Equations (iii) and (iv) assert that the same is true for infinite sums, provided we are dealing with *power series*. (For other types of series of functions the situation is not as simple; see Exercise 44.)

**NOTE 2** Although Theorem 2 says that the radius of convergence remains the same when a power series is differentiated or integrated, this does not mean that the *interval* of convergence remains the same. It may happen that the original series converges at an endpoint, whereas the differentiated series diverges there. (See Exercise 45.)

The idea of differentiating a power series term by term is the basis for a powerful method for solving differential equations. In Exercises 37–40 you will see how a function expressed as a power series can be a solution to a differential equation.

**EXAMPLE 4** Express  $1/(1 - x)^2$  as a power series by differentiating Equation 1. What is the radius of convergence?

**SOLUTION** We start with

$$\frac{1}{1 - x} = 1 + x + x^2 + x^3 + \dots = \sum_{n=0}^{\infty} x^n$$

Differentiating each side, we get

$$\frac{1}{(1 - x)^2} = 1 + 2x + 3x^2 + \dots = \sum_{n=1}^{\infty} nx^{n-1}$$

If we wish, we can replace  $n$  by  $n + 1$  and write the answer as

$$\frac{1}{(1-x)^2} = \sum_{n=0}^{\infty} (n+1)x^n$$

According to Theorem 2, the radius of convergence of the differentiated series is the same as the radius of convergence of the original series, namely,  $R = 1$ . ■

**EXAMPLE 5** Find a power series representation for  $\ln(1+x)$  and its radius of convergence.

**SOLUTION** We notice that the derivative of this function is  $1/(1+x)$ . From Equation 1 we have

$$\frac{1}{1+x} = \frac{1}{1-(-x)} = 1 - x + x^2 - x^3 + \dots \quad |x| < 1$$

Integrating both sides of this equation, we get

$$\begin{aligned} \ln(1+x) &= \int \frac{1}{1+x} dx = \int (1 - x + x^2 - x^3 + \dots) dx \\ &= x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots + C \\ &= \sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n} + C \quad |x| < 1 \end{aligned}$$

To determine the value of  $C$  we put  $x = 0$  in this equation and obtain  $\ln(1+0) = C$ . Thus  $C = 0$  and

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n} \quad |x| < 1$$

The radius of convergence is the same as for the original series:  $R = 1$ . ■

**EXAMPLE 6** Find a power series representation for  $f(x) = \tan^{-1}x$ .

**SOLUTION** We observe that  $f'(x) = 1/(1+x^2)$  and find the required series by integrating the power series for  $1/(1+x^2)$  found in Example 1.

$$\begin{aligned} \tan^{-1}x &= \int \frac{1}{1+x^2} dx = \int (1 - x^2 + x^4 - x^6 + \dots) dx \\ &= C + x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots \end{aligned}$$

To find  $C$  we put  $x = 0$  and obtain  $C = \tan^{-1}0 = 0$ . Therefore

$$\begin{aligned} \tan^{-1}x &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots \\ &= \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2n+1} \end{aligned}$$

Since the radius of convergence of the series for  $1/(1+x^2)$  is 1, the radius of convergence of this series for  $\tan^{-1}x$  is also 1. ■

The power series for  $\tan^{-1}x$  obtained in Example 6 is called *Gregory's series* after the Scottish mathematician James Gregory (1638–1675), who had anticipated some of Newton's discoveries. We have shown that Gregory's series is valid when  $-1 < x < 1$ , but it turns out (although it isn't easy to prove) that it is also valid when  $x = \pm 1$ . Notice that when  $x = 1$  the series becomes

$$\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$$

This beautiful result is known as the Leibniz formula for  $\pi$ .

**EXAMPLE 7**

- (a) Evaluate  $\int [1/(1+x^7)] dx$  as a power series.  
 (b) Use part (a) to approximate  $\int_0^{0.5} [1/(1+x^7)] dx$  correct to within  $10^{-7}$ .

**SOLUTION**

- (a) The first step is to express the integrand,  $1/(1+x^7)$ , as the sum of a power series. As in Example 1, we start with Equation 1 and replace  $x$  by  $-x^7$ :

$$\begin{aligned}\frac{1}{1+x^7} &= \frac{1}{1-(-x^7)} = \sum_{n=0}^{\infty} (-x^7)^n \\ &= \sum_{n=0}^{\infty} (-1)^n x^{7n} = 1 - x^7 + x^{14} - \dots\end{aligned}$$

This example demonstrates one way in which power series representations are useful. Integrating  $1/(1+x^7)$  by hand is incredibly difficult. Different computer algebra systems return different forms of the answer, but they are all extremely complicated. The infinite series answer that we obtain in Example 7(a) is actually much easier to deal with than the finite answer provided by a computer.

Now we integrate term by term:

$$\begin{aligned}\int \frac{1}{1+x^7} dx &= \int \sum_{n=0}^{\infty} (-1)^n x^{7n} dx = C + \sum_{n=0}^{\infty} (-1)^n \frac{x^{7n+1}}{7n+1} \\ &= C + x - \frac{x^8}{8} + \frac{x^{15}}{15} - \frac{x^{22}}{22} + \dots\end{aligned}$$

This series converges for  $|x| < 1$ , that is, for  $|x| < 1$ .

- (b) In applying the Fundamental Theorem of Calculus, it doesn't matter which antiderivative we use, so let's use the antiderivative from part (a) with  $C = 0$ :

$$\begin{aligned}\int_0^{0.5} \frac{1}{1+x^7} dx &= \left[ x - \frac{x^8}{8} + \frac{x^{15}}{15} - \frac{x^{22}}{22} + \dots \right]_0^{1/2} \\ &= \frac{1}{2} - \frac{1}{8 \cdot 2^8} + \frac{1}{15 \cdot 2^{15}} - \frac{1}{22 \cdot 2^{22}} + \dots + \frac{(-1)^n}{(7n+1)2^{7n+1}} + \dots\end{aligned}$$

This infinite series is the exact value of the definite integral, but since it is an alternating series, we can approximate the sum using the Alternating Series Estimation Theorem. If we stop adding after the term with  $n = 3$ , the error is smaller than the term with  $n = 4$ :

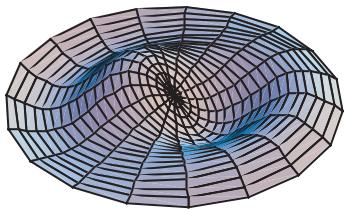

$$\frac{1}{29 \cdot 2^{29}} \approx 6.4 \times 10^{-11}$$

So we have

$$\int_0^{0.5} \frac{1}{1+x^7} dx \approx \frac{1}{2} - \frac{1}{8 \cdot 2^8} + \frac{1}{15 \cdot 2^{15}} - \frac{1}{22 \cdot 2^{22}} \approx 0.49951374$$

### ■ Functions Defined by Power Series

Some of the most important functions in the sciences are defined by power series and are not expressible in terms of elementary functions (as described in Section 7.5). Many of these arise naturally as solutions of differential equations. One such class of functions is the **Bessel functions**, named after the German astronomer Friedrich Bessel (1784–1846). These functions first arose when Bessel solved Kepler's equation for describing planetary motion. Since that time, Bessel functions have been applied in many different physical situations, including the temperature distribution in a circular plate and the shape of a vibrating drumhead. Bessel functions appear in the next example as well as in Exercises 39 and 40. Other examples of functions defined by power series are given in Exercises 38 and 41.

A computer-generated model, involving Bessel functions and cosine functions, of a vibrating drumhead.

**EXAMPLE 8** The Bessel function of order 0 is defined by

$$J_0(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{2^{2n} (n!)^2}$$

- (a) Find the domain of  $J_0$ .
- (b) Find the derivative of  $J_0$ .

**SOLUTION**

- (a) Let  $a_n = (-1)^n x^{2n}/[2^{2n} (n!)^2]$ . Then

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{(-1)^{n+1} x^{2(n+1)}}{2^{2(n+1)} [(n+1)!]^2} \cdot \frac{2^{2n} (n!)^2}{(-1)^n x^{2n}} \right| \\ &= \frac{x^{2n+2}}{2^{2n+2} (n+1)^2 (n!)^2} \cdot \frac{2^{2n} (n!)^2}{x^{2n}} \\ &= \frac{x^2}{4(n+1)^2} \rightarrow 0 < 1 \quad \text{for all } x \end{aligned}$$

Thus, by the Ratio Test, the given series converges for all values of  $x$ . In other words, the domain of the Bessel function  $J_0$  is  $(-\infty, \infty) = \mathbb{R}$ .

- (b) By Theorem 2,  $J_0$  is differentiable for all  $x$  and its derivative is found by term-by-term differentiation as follows:

$$J'_0(x) = \sum_{n=0}^{\infty} \frac{d}{dx} \frac{(-1)^n x^{2n}}{2^{2n} (n!)^2} = \sum_{n=1}^{\infty} \frac{(-1)^n 2nx^{2n-1}}{2^{2n} (n!)^2}$$

■

Recall that the sum of a series is equal to the limit of the sequence of partial sums. So when we define the Bessel function in Example 8 as the sum of a series we mean that, for every real number  $x$ ,

$$J_0(x) = \lim_{n \rightarrow \infty} s_n(x) \quad \text{where} \quad s_n(x) = \sum_{i=0}^n \frac{(-1)^i x^{2i}}{2^{2i} (i!)^2}$$

The first few partial sums are

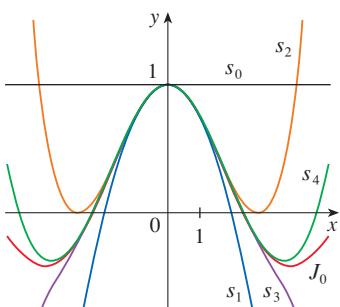

$$s_0(x) = 1$$

$$s_1(x) = 1 - \frac{x^2}{4}$$

$$s_2(x) = 1 - \frac{x^2}{4} + \frac{x^4}{64}$$

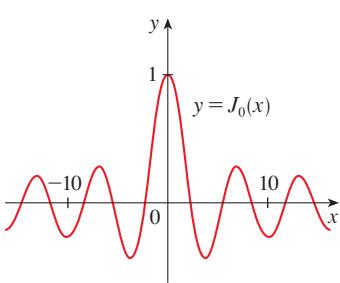

$$s_3(x) = 1 - \frac{x^2}{4} + \frac{x^4}{64} - \frac{x^6}{2304}$$

$$s_4(x) = 1 - \frac{x^2}{4} + \frac{x^4}{64} - \frac{x^6}{2304} + \frac{x^8}{147,456}$$

**FIGURE 2**

Partial sums of the Bessel function  $J_0$

**FIGURE 3**

Figure 2 shows the graphs of these partial sums, which are polynomials. They are all approximations to the function  $J_0$ , but the approximations become better when more terms are included. Figure 3 shows a more complete graph of the Bessel function.

## 11.9 | Exercises

1. If the radius of convergence of the power series  $\sum_{n=0}^{\infty} c_n x^n$  is 10, what is the radius of convergence of the series  $\sum_{n=1}^{\infty} n c_n x^{n-1}$ ? Why?
2. Suppose you know that the series  $\sum_{n=0}^{\infty} b_n x^n$  converges for  $|x| < 2$ . What can you say about the following series? Why?

$$\sum_{n=0}^{\infty} \frac{b_n}{n+1} x^{n+1}$$

**3–12** Find a power series representation for the function and determine the interval of convergence.

<p>3. <math>f(x) = \frac{1}{1+x}</math></p> <p>5. <math>f(x) = \frac{1}{1-x^2}</math></p> <p>7. <math>f(x) = \frac{2}{3-x}</math></p> <p>9. <math>f(x) = \frac{x^2}{x^4+16}</math></p> <p>11. <math>f(x) = \frac{x-1}{x+2}</math></p>	<p>4. <math>f(x) = \frac{x}{1+x}</math></p> <p>6. <math>f(x) = \frac{5}{1-4x^2}</math></p> <p>8. <math>f(x) = \frac{4}{2x+3}</math></p> <p>10. <math>f(x) = \frac{x}{2x^2+1}</math></p> <p>12. <math>f(x) = \frac{x+a}{x^2+a^2}, \quad a &gt; 0</math></p>
---	--

**13–14** Express the function as the sum of a power series by first using partial fractions. Find the interval of convergence.

<p>13. <math>f(x) = \frac{2x-4}{x^2-4x+3}</math></p>	<p>14. <math>f(x) = \frac{2x+3}{x^2+3x+2}</math></p>
--	--

- 15.** (a) Use differentiation to find a power series representation for

$$f(x) = \frac{1}{(1+x)^2}$$

What is the radius of convergence?

- (b) Use part (a) to find a power series for

$$f(x) = \frac{1}{(1+x)^3}$$

- (c) Use part (b) to find a power series for

$$f(x) = \frac{x^2}{(1+x)^3}$$

- 16.** (a) Use Equation 1 to find a power series representation for  $f(x) = \ln(1-x)$ . What is the radius of convergence?
- (b) Use part (a) to find a power series for  $f(x) = x \ln(1-x)$ .
- (c) By putting  $x = \frac{1}{2}$  in your result from part (a), express  $\ln 2$  as the sum of an infinite series.

- 17–22** Find a power series representation for the function and determine the radius of convergence.

<p>17. <math>f(x) = \frac{x}{(1+4x)^2}</math></p> <p>19. <math>f(x) = \frac{1+x}{(1-x)^2}</math></p> <p>21. <math>f(x) = \ln(5-x)</math></p>	<p>18. <math>f(x) = \left(\frac{x}{2-x}\right)^3</math></p> <p>20. <math>f(x) = \frac{x^2+x}{(1-x)^3}</math></p> <p>22. <math>f(x) = x^2 \tan^{-1}(x^3)</math></p>
--	--

 **23–26** Find a power series representation for  $f$ , and graph  $f$  and several partial sums  $s_n(x)$  on the same screen. What happens as  $n$  increases?

<p>23. <math>f(x) = \frac{x^2}{x^2+1}</math></p> <p>25. <math>f(x) = \ln\left(\frac{1+x}{1-x}\right)</math></p>	<p>24. <math>f(x) = \ln(1+x^4)</math></p> <p>26. <math>f(x) = \tan^{-1}(2x)</math></p>
---	--

**27–30** Evaluate the indefinite integral as a power series. What is the radius of convergence?

<p>27. <math>\int \frac{t}{1-t^8} dt</math></p> <p>29. <math>\int x^2 \ln(1+x) dx</math></p>	<p>28. <math>\int \frac{t}{1+t^3} dt</math></p> <p>30. <math>\int \frac{\tan^{-1} x}{x} dx</math></p>
--	---

**31–34** Use a power series to approximate the definite integral to six decimal places.

<p>31. <math>\int_0^{0.3} \frac{x}{1+x^3} dx</math></p> <p>33. <math>\int_0^{0.2} x \ln(1+x^2) dx</math></p>	<p>32. <math>\int_0^{1/2} \arctan \frac{x}{2} dx</math></p> <p>34. <math>\int_0^{0.3} \frac{x^2}{1+x^4} dx</math></p>
--	---

- 35.** Use the result of Example 6 to compute  $\arctan 0.2$  correct to five decimal places.

- 36.** Use the result of Example 5 to compute  $\ln 1.1$  correct to four decimal places.

- 37.** (a) Show that the function

$$f(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

is a solution of the differential equation

$$f'(x) = f(x)$$

- (b) Show that  $f(x) = e^x$ .

- 38.** Show that the function

$$f(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$$

is a solution of the differential equation

$$f''(x) + f(x) = 0$$

- 39.** (a) Show that  $J_0$  (the Bessel function of order 0 given in Example 8) satisfies the differential equation

$$x^2 J_0''(x) + x J_0'(x) + x^2 J_0(x) = 0$$

- (b) Evaluate  $\int_0^1 J_0(x) dx$  correct to three decimal places.

- 40.** The Bessel function of order 1 is defined by

$$J_1(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{n!(n+1)!2^{2n+1}}$$

- (a) Find the domain of  $J_1$ .

- (b) Show that  $J_1$  satisfies the differential equation

$$x^2 J_1''(x) + x J_1'(x) + (x^2 - 1) J_1(x) = 0$$

- (c) Show that  $J_0'(x) = -J_1(x)$ .

- 41.** The function  $A$  defined by

$$A(x) = 1 + \frac{x^3}{2 \cdot 3} + \frac{x^6}{2 \cdot 3 \cdot 5 \cdot 6} + \frac{x^9}{2 \cdot 3 \cdot 5 \cdot 6 \cdot 8 \cdot 9} + \dots$$

is called an *Airy function* after the English mathematician and astronomer Sir George Airy (1801–1892).

- (a) Find the domain of the Airy function.

- (b) Graph the first several partial sums on a common screen.

- (c) Use a computer algebra system that has built-in Airy functions to graph  $A$  on the same screen as the partial sums in part (b) and observe how the partial sums approximate  $A$ .

- 42.** If  $f(x) = \sum_{n=0}^{\infty} c_n x^n$ , where  $c_{n+4} = c_n$  for all  $n \geq 0$ , find the interval of convergence of the series and a formula for  $f(x)$ .

- 43.** A function  $f$  is defined by

$$f(x) = 1 + 2x + x^2 + 2x^3 + x^4 + \dots$$

that is, its coefficients are  $c_{2n} = 1$  and  $c_{2n+1} = 2$  for all  $n \geq 0$ . Find the interval of convergence of the series and find an explicit formula for  $f(x)$ .

- 44.** Let  $f_n(x) = (\sin nx)/n^2$ . Show that the series  $\sum f_n(x)$  converges for all values of  $x$  but the series of derivatives  $\sum f'_n(x)$  diverges when  $x = 2n\pi$ ,  $n$  an integer. For what values of  $x$  does the series  $\sum f''_n(x)$  converge?

- 45.** Let

$$f(x) = \sum_{n=1}^{\infty} \frac{x^n}{n^2}$$

Find the intervals of convergence for  $f$ ,  $f'$ , and  $f''$ .

- 46.** (a) Starting with the geometric series  $\sum_{n=0}^{\infty} x^n$ , find the sum of the series

$$\sum_{n=1}^{\infty} n x^{n-1} \quad |x| < 1$$

- (b) Find the sum of each of the following series.

$$(i) \sum_{n=1}^{\infty} n x^n, \quad |x| < 1 \quad (ii) \sum_{n=1}^{\infty} \frac{n}{2^n}$$

- (c) Find the sum of each of the following series.

$$(i) \sum_{n=2}^{\infty} n(n-1)x^n, \quad |x| < 1$$

$$(ii) \sum_{n=2}^{\infty} \frac{n^2 - n}{2^n} \quad (iii) \sum_{n=1}^{\infty} \frac{n^2}{2^n}$$

- 47.** If  $f(x) = 1/(1-x)$ , find a power series representation for  $h(x) = xf'(x) + x^2 f''(x)$  and determine the radius of convergence. Use this to show that

$$\sum_{n=1}^{\infty} \frac{n^2}{2^n} = 6$$

- 48.** Use the power series representation of  $f(x) = 1/(1-x)^2$  and the fact that  $9801 = 99^2$  to show that  $1/9801$  is a repeating decimal that contains every two digit number in order, except for 98, as shown.

$$\frac{1}{9801} = 0.\overline{00\ 01\ 02\ 03\ \dots\ 96\ 97\ 99}$$

[Hint: Consider  $x = \frac{1}{100}$ .]

- 49.** Use the power series for  $\tan^{-1} x$  to prove the following expression for  $\pi$  as the sum of an infinite series:

$$\pi = 2\sqrt{3} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)3^n}$$

- 50.** (a) By completing the square, show that

$$\int_0^{1/2} \frac{dx}{x^2 - x + 1} = \frac{\pi}{3\sqrt{3}}$$

- (b) By factoring  $x^3 + 1$  as a sum of cubes, rewrite the integral in part (a). Then express  $1/(x^3 + 1)$  as the sum of a power series and use it to prove the following formula for  $\pi$ :

$$\pi = \frac{3\sqrt{3}}{4} \sum_{n=0}^{\infty} \frac{(-1)^n}{8^n} \left( \frac{2}{3n+1} + \frac{1}{3n+2} \right)$$

- 51.** Use the Ratio Test to show that if the series  $\sum_{n=0}^{\infty} c_n x^n$  has radius of convergence  $R$ , then each of the series

$$\sum_{n=1}^{\infty} n c_n x^{n-1} \quad \text{and} \quad \sum_{n=0}^{\infty} c_n \frac{x^{n+1}}{n+1}$$

also has radius of convergence  $R$ .

## 11.10 | Taylor and Maclaurin Series

In Section 11.9 we were able to find power series representations for a certain restricted class of functions, namely, those that can be obtained from geometric series. Here we investigate more general problems: Which functions have power series representations? How can we find such representations? We will see that some of the most important functions in calculus, such as  $e^x$  and  $\sin x$ , can be represented as power series.

### ■ Definitions of Taylor Series and Maclaurin Series

We start by supposing that  $f$  is a function that can be represented by a power series

$$\boxed{1} \quad f(x) = c_0 + c_1(x - a) + c_2(x - a)^2 + c_3(x - a)^3 + c_4(x - a)^4 + \dots \quad |x - a| < R$$

Let's try to determine what the coefficients  $c_n$  must be in terms of  $f$ . To begin, notice that if we put  $x = a$  in Equation 1, then all terms after the first one are 0 and we get

$$f(a) = c_0$$

By Theorem 11.9.2, we can differentiate the series in Equation 1 term by term:

$$\boxed{2} \quad f'(x) = c_1 + 2c_2(x - a) + 3c_3(x - a)^2 + 4c_4(x - a)^3 + \dots \quad |x - a| < R$$

and substitution of  $x = a$  in Equation 2 gives

$$f'(a) = c_1$$

Now we differentiate both sides of Equation 2 and obtain

$$\boxed{3} \quad f''(x) = 2c_2 + 2 \cdot 3c_3(x - a) + 3 \cdot 4c_4(x - a)^2 + \dots \quad |x - a| < R$$

Again we put  $x = a$  in Equation 3. The result is

$$f''(a) = 2c_2$$

Let's apply the procedure one more time. Differentiation of the series in Equation 3 gives

$$\boxed{4} \quad f'''(x) = 2 \cdot 3c_3 + 2 \cdot 3 \cdot 4c_4(x - a) + 3 \cdot 4 \cdot 5c_5(x - a)^2 + \dots \quad |x - a| < R$$

and substitution of  $x = a$  in Equation 4 gives

$$f'''(a) = 2 \cdot 3c_3 = 3!c_3$$

By now you can see the pattern. If we continue to differentiate and substitute  $x = a$ , we obtain

$$f^{(n)}(a) = 2 \cdot 3 \cdot 4 \cdot \dots \cdot nc_n = n!c_n$$

Solving this equation for the  $n$ th coefficient  $c_n$ , we get

$$c_n = \frac{f^{(n)}(a)}{n!}$$

This formula remains valid even for  $n = 0$  if we adopt the conventions that  $0! = 1$  and  $f^{(0)} = f$ . Thus we have proved the following theorem.

**5 Theorem** If  $f$  has a power series representation (expansion) at  $a$ , that is, if

$$f(x) = \sum_{n=0}^{\infty} c_n(x - a)^n \quad |x - a| < R$$

then its coefficients are given by the formula

$$c_n = \frac{f^{(n)}(a)}{n!}$$

Substituting this formula for  $c_n$  back into the series, we see that if  $f$  has a power series expansion at  $a$ , then it must be of the following form.

$$\begin{aligned} \text{6} \quad f(x) &= \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x - a)^n \\ &= f(a) + \frac{f'(a)}{1!} (x - a) + \frac{f''(a)}{2!} (x - a)^2 + \frac{f'''(a)}{3!} (x - a)^3 + \dots \end{aligned}$$

### Taylor and Maclaurin

The Taylor series is named after the English mathematician Brook Taylor (1685–1731) and the Maclaurin series is named in honor of the Scottish mathematician Colin Maclaurin (1698–1746) despite the fact that the Maclaurin series is really just a special case of the Taylor series. But the idea of representing particular functions as sums of power series goes back to Newton, and the general Taylor series was known to the Scottish mathematician James Gregory in 1668 and to the Swiss mathematician John Bernoulli in the 1690s. Taylor was apparently unaware of the work of Gregory and Bernoulli when he published his discoveries on series in 1715 in his book *Methodus incrementorum directa et inversa*. Maclaurin series are named after Colin Maclaurin because he popularized them in his calculus textbook *Treatise of Fluxions* published in 1742.

The series in Equation 6 is called the **Taylor series of the function  $f$  at  $a$**  (or **about  $a$**  or **centered at  $a$** ). For the special case  $a = 0$  the Taylor series becomes

$$\text{7} \quad f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = f(0) + \frac{f'(0)}{1!} x + \frac{f''(0)}{2!} x^2 + \dots$$

This case arises frequently enough that it is given the special name **Maclaurin series**.

**NOTE 1** When we find a Taylor series for a function  $f$ , there is no guarantee that the sum of the Taylor series is equal to  $f$ . Theorem 5 says that if  $f$  has a power series representation about  $a$ , then that power series must be the Taylor series of  $f$ . There exist functions that are not equal to the sum of their Taylor series, such as the function given in Exercise 96.

**NOTE 2** The power series representation at  $a$  of a function is unique, regardless of how it is found, because Theorem 5 states that if  $f$  has a power series representation  $f(x) = \sum c_n(x - a)^n$ , then  $c_n$  must be  $f^{(n)}(a)/n!$ . Thus all the power series representations we developed in Section 11.9 are in fact the Taylor series of the functions they represent.

**EXAMPLE 1** We know from Equation 11.9.1 that the function  $f(x) = 1/(1 - x)$  has a power series representation

$$\frac{1}{1 - x} = \sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots \quad |x| < 1$$

According to Theorem 5, this series must be the Maclaurin series of  $f$  with coefficients  $c_n$  given by  $f^{(n)}(0)/n!$ . To confirm this, we compute

$$f(x) = \frac{1}{1-x} \quad f(0) = 1$$

$$f'(x) = \frac{1}{(1-x)^2} \quad f'(0) = 1$$

$$f''(x) = \frac{1 \cdot 2}{(1-x)^3} \quad f''(0) = 1 \cdot 2$$

$$f'''(x) = \frac{1 \cdot 2 \cdot 3}{(1-x)^4} \quad f'''(0) = 1 \cdot 2 \cdot 3$$

and, in general,

$$f^{(n)}(x) = \frac{n!}{(1-x)^{n+1}} \quad f^{(n)}(0) = n!$$

Thus

$$c_n = \frac{f^{(n)}(0)}{n!} = \frac{n!}{n!} = 1$$

and, from Equation 7,

$$\frac{1}{1-x} = \sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = \sum_{n=0}^{\infty} x^n$$

**EXAMPLE 2** For the function  $f(x) = e^x$ , find the Maclaurin series and its radius of convergence.

**SOLUTION** If  $f(x) = e^x$ , then  $f^{(n)}(x) = e^x$ , so  $f^{(n)}(0) = e^0 = 1$  for all  $n$ . Therefore the Taylor series for  $f$  at 0 (that is, the Maclaurin series) is

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$

To find the radius of convergence we let  $a_n = x^n/n!$ . Then

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{x^{n+1}}{(n+1)!} \cdot \frac{n!}{x^n} \right| = \frac{|x|}{n+1} \rightarrow 0 < 1$$

so, by the Ratio Test, the series converges for all  $x$  and the radius of convergence is  $R = \infty$ .

### When Is a Function Represented by Its Taylor Series?

From Theorem 5 and Example 2 we can conclude that if we know that  $e^x$  has a power series representation at 0, then this power series must be its Maclaurin series

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

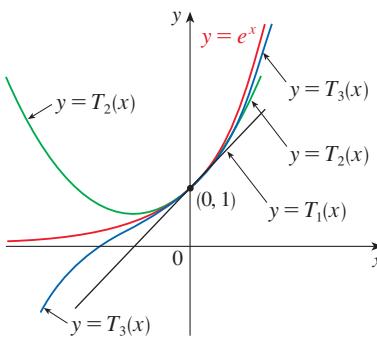

So how can we determine whether  $e^x$  does have a power series representation?

Let's investigate the more general question: under what circumstances is a function equal to the sum of its Taylor series? In other words, if  $f$  has derivatives of all orders, when is it true that

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x - a)^n$$

As with any convergent series, this means that  $f(x)$  is the limit of the sequence of partial sums. In the case of the Taylor series, the partial sums are

$$\begin{aligned} T_n(x) &= \sum_{i=0}^n \frac{f^{(i)}(a)}{i!} (x - a)^i \\ &= f(a) + \frac{f'(a)}{1!} (x - a) + \frac{f''(a)}{2!} (x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!} (x - a)^n \end{aligned}$$

**FIGURE 1**

As  $n$  increases,  $T_n(x)$  appears to approach  $e^x$  in Figure 1. This suggests that  $e^x$  is equal to the sum of its Taylor series.

Notice that  $T_n$  is a polynomial of degree  $n$  called the  **$n$ th-degree Taylor polynomial of  $f$  at  $a$** . For instance, for the exponential function  $f(x) = e^x$ , the result of Example 2 shows that the Taylor polynomials at 0 (or Maclaurin polynomials) with  $n = 1, 2$ , and 3 are

$$T_1(x) = 1 + x \quad T_2(x) = 1 + x + \frac{x^2}{2!} \quad T_3(x) = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!}$$

The graphs of the exponential function and these three Taylor polynomials are drawn in Figure 1.

In general,  $f(x)$  is the sum of its Taylor series if

$$f(x) = \lim_{n \rightarrow \infty} T_n(x)$$

If we let

$$R_n(x) = f(x) - T_n(x) \quad \text{so that} \quad f(x) = T_n(x) + R_n(x)$$

then  $R_n(x)$  is called the **remainder** of the Taylor series. If we can somehow show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ , then it follows that

$$\lim_{n \rightarrow \infty} T_n(x) = \lim_{n \rightarrow \infty} [f(x) - R_n(x)] = f(x) - \lim_{n \rightarrow \infty} R_n(x) = f(x)$$

We have therefore proved the following theorem.

**8 Theorem** If  $f(x) = T_n(x) + R_n(x)$ , where  $T_n$  is the  $n$ th-degree Taylor polynomial of  $f$  at  $a$ , and if

$$\lim_{n \rightarrow \infty} R_n(x) = 0$$

for  $|x - a| < R$ , then  $f$  is equal to the sum of its Taylor series on the interval  $|x - a| < R$ .

In trying to show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$  for a specific function  $f$ , we usually use the following theorem.

**9 Taylor's Inequality** If  $|f^{(n+1)}(x)| \leq M$  for  $|x - a| \leq d$ , then the remainder  $R_n(x)$  of the Taylor series satisfies the inequality

$$|R_n(x)| \leq \frac{M}{(n+1)!} |x - a|^{n+1} \quad \text{for } |x - a| \leq d$$

**PROOF** We first prove Taylor's Inequality for  $n = 1$ . Assume that  $|f''(x)| \leq M$ . In particular, we have  $f''(x) \leq M$ , so for  $a \leq x \leq a + d$  we have

$$\int_a^x f''(t) dt \leq \int_a^x M dt$$

### Formulas for the Taylor Remainder Term

As alternatives to Taylor's Inequality, we have the following formulas for the remainder term. If  $f^{(n+1)}$  is continuous on an interval  $I$  and  $x \in I$ , then

$$R_n(x) = \frac{1}{n!} \int_a^x (x - t)^n f^{(n+1)}(t) dt$$

This is called the *integral form of the remainder term*. Another formula, called *Lagrange's form of the remainder term*, states that there is a number  $z$  between  $x$  and  $a$  such that

$$R_n(x) = \frac{f^{(n+1)}(z)}{(n+1)!} (x - a)^{n+1}$$

This version is an extension of the Mean Value Theorem (which is the case  $n = 0$ ).

Proofs of these formulas, together with discussions of how to use them to solve the examples of Sections 11.10 and 11.11, are given on the website

[www.StewartCalculus.com](http://www.StewartCalculus.com)

Click on *Additional Topics* and then on *Formulas for the Remainder Term in Taylor series*.

An antiderivative of  $f''$  is  $f'$ , so by Part 2 of the Fundamental Theorem of Calculus, we have

$$f'(x) - f'(a) \leq M(x - a) \quad \text{or} \quad f'(x) \leq f'(a) + M(x - a)$$

Thus

$$\int_a^x f'(t) dt \leq \int_a^x [f'(a) + M(t - a)] dt$$

$$f(x) - f(a) \leq f'(a)(x - a) + M \frac{(x - a)^2}{2}$$

$$f(x) - f(a) - f'(a)(x - a) \leq \frac{M}{2} (x - a)^2$$

But  $R_1(x) = f(x) - T_1(x) = f(x) - f(a) - f'(a)(x - a)$ . So

$$R_1(x) \leq \frac{M}{2} (x - a)^2$$

A similar argument, using  $f''(x) \geq -M$ , shows that

$$R_1(x) \geq -\frac{M}{2} (x - a)^2$$

So

$$|R_1(x)| \leq \frac{M}{2} |x - a|^2$$

Although we have assumed that  $x > a$ , similar calculations show that this inequality is also true for  $x < a$ .

This proves Taylor's Inequality for the case where  $n = 1$ . The result for any  $n$  is proved in a similar way by integrating  $n + 1$  times. (See Exercise 95 for the case  $n = 2$ .)

**NOTE** In Section 11.11 we will explore the use of Taylor's Inequality in approximating functions. Our immediate use of it is in conjunction with Theorem 8.

When we apply Theorems 8 and 9 it is often helpful to make use of the following fact.

10

$$\lim_{n \rightarrow \infty} \frac{x^n}{n!} = 0 \quad \text{for every real number } x$$

This is true because we know from Example 2 that the series  $\sum x^n/n!$  converges for all  $x$  and so its  $n$ th term approaches 0.

**EXAMPLE 3** Prove that  $e^x$  is equal to the sum of its Maclaurin series.

**SOLUTION** If  $f(x) = e^x$ , then  $f^{(n+1)}(x) = e^x$  for all  $n$ . If  $d$  is any positive number and  $|x| \leq d$ , then  $|f^{(n+1)}(x)| = e^x \leq e^d$ . So Taylor's Inequality, with  $a = 0$  and  $M = e^d$ , says that

$$|R_n(x)| \leq \frac{e^d}{(n+1)!} |x|^{n+1} \quad \text{for } |x| \leq d$$

Notice that the same constant  $M = e^d$  works for every value of  $n$ . But, from Equation 10, we have

$$\lim_{n \rightarrow \infty} \frac{e^d}{(n+1)!} |x|^{n+1} = e^d \lim_{n \rightarrow \infty} \frac{|x|^{n+1}}{(n+1)!} = 0$$

It follows from the Squeeze Theorem that  $\lim_{n \rightarrow \infty} |R_n(x)| = 0$  and therefore  $\lim_{n \rightarrow \infty} R_n(x) = 0$  for all values of  $x$ . By Theorem 8,  $e^x$  is equal to the sum of its Maclaurin series, that is,

11

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} \quad \text{for all } x$$

In particular, if we put  $x = 1$  in Equation 11, we obtain the following expression for the number  $e$  as a sum of an infinite series:

12

$$e = \sum_{n=0}^{\infty} \frac{1}{n!} = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \dots$$

With the help of computers, researchers have now accurately computed the value of  $e$  to trillions of decimal places.

**EXAMPLE 4** Find the Taylor series for  $f(x) = e^x$  at  $a = 2$ .

**SOLUTION** We have  $f^{(n)}(2) = e^2$  and so, putting  $a = 2$  in the definition of a Taylor series (6), we get

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(2)}{n!} (x-2)^n = \sum_{n=0}^{\infty} \frac{e^2}{n!} (x-2)^n$$

Again it can be verified, as in Example 2, that the radius of convergence is  $R = \infty$ . As in Example 3 we can verify that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ , so

13

$$e^x = \sum_{n=0}^{\infty} \frac{e^2}{n!} (x-2)^n \quad \text{for all } x$$

We have two power series expansions for  $e^x$ , the Maclaurin series in Equation 11 and the Taylor series in Equation 13. The first is better if we are interested in values of  $x$  near 0 and the second is better if  $x$  is near 2.

### Taylor Series of Important Functions

In Examples 2 and 4 we developed power series representations of the function  $e^x$ , and in Section 11.9 we found power series representations for several other functions, including  $\ln(1+x)$  and  $\tan^{-1}x$ . We now find representations for some additional important functions, including  $\sin x$  and  $\cos x$ .

**EXAMPLE 5** Find the Maclaurin series for  $\sin x$  and prove that it represents  $\sin x$  for all  $x$ .

**SOLUTION** We arrange our computation in two columns:

$$\begin{array}{ll} f(x) = \sin x & f(0) = 0 \\ f'(x) = \cos x & f'(0) = 1 \\ f''(x) = -\sin x & f''(0) = 0 \\ f'''(x) = -\cos x & f'''(0) = -1 \\ f^{(4)}(x) = \sin x & f^{(4)}(0) = 0 \end{array}$$

Figure 2 shows the graph of  $\sin x$  together with its Taylor (or Maclaurin) polynomials

$$T_1(x) = x$$

$$T_3(x) = x - \frac{x^3}{3!}$$

$$T_5(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!}$$

Notice that, as  $n$  increases,  $T_n(x)$  becomes a better approximation to  $\sin x$ .

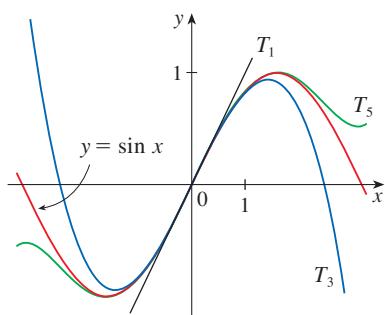

FIGURE 2

Since the derivatives repeat in a cycle of four, we can write the Maclaurin series as follows:

$$\begin{aligned} f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \cdots \\ = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!} \end{aligned}$$

Since  $f^{(n+1)}(x)$  is  $\pm \sin x$  or  $\pm \cos x$ , we know that  $|f^{(n+1)}(x)| \leq 1$  for all  $x$ . So we can take  $M = 1$  in Taylor's Inequality:

$$|R_n(x)| \leq \frac{M}{(n+1)!} |x^{n+1}| = \frac{|x|^{n+1}}{(n+1)!}$$

By Equation 10 the right side of this inequality approaches 0 as  $n \rightarrow \infty$ , so  $|R_n(x)| \rightarrow 0$  by the Squeeze Theorem. It follows that  $R_n(x) \rightarrow 0$  as  $n \rightarrow \infty$ , so  $\sin x$  is equal to the sum of its Maclaurin series by Theorem 8. ■

We state the result of Example 5 for future reference.

15

$$\begin{aligned} \sin x &= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \\ &= \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!} \quad \text{for all } x \end{aligned}$$

**EXAMPLE 6** Find the Maclaurin series for  $\cos x$ .

**SOLUTION** We could proceed directly as in Example 5, but it's easier to use Theorem 11.9.2 to differentiate the Maclaurin series for  $\sin x$  given by Equation 15:

$$\begin{aligned} \cos x &= \frac{d}{dx} (\sin x) = \frac{d}{dx} \left( x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \right) \\ &= 1 - \frac{3x^2}{3!} + \frac{5x^4}{5!} - \frac{7x^6}{7!} + \cdots = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots \end{aligned}$$

The Maclaurin series for  $e^x$ ,  $\sin x$ , and  $\cos x$  that we found in Examples 3, 5, and 6 were discovered, using different methods, by Newton. These equations are remarkable because they say we know everything about each of these functions if we know all its derivatives at the single number 0.

Theorem 11.9.2 tells us that the differentiated series for  $\sin x$  converges to the derivative of  $\sin x$ , namely  $\cos x$ , and the radius of convergence remains unchanged, so the series converges for all  $x$ . ■

We state the result of Example 6 for future reference.

**16**

$$\begin{aligned}\cos x &= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots \\ &= \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!} \quad \text{for all } x\end{aligned}$$

**EXAMPLE 7** Represent  $f(x) = \sin x$  as the sum of its Taylor series centered at  $\pi/3$ .

**SOLUTION** Arranging our work in columns, we have

$$f(x) = \sin x \qquad f\left(\frac{\pi}{3}\right) = \frac{\sqrt{3}}{2}$$

$$f'(x) = \cos x \qquad f'\left(\frac{\pi}{3}\right) = \frac{1}{2}$$

$$f''(x) = -\sin x \qquad f''\left(\frac{\pi}{3}\right) = -\frac{\sqrt{3}}{2}$$

$$f'''(x) = -\cos x \qquad f'''\left(\frac{\pi}{3}\right) = -\frac{1}{2}$$

We have obtained two different series representations for  $\sin x$ , the Maclaurin series in Example 5 and the Taylor series in Example 7. It is best to use the Maclaurin series for values of  $x$  near 0 and the Taylor series for  $x$  near  $\pi/3$ . Notice that the third Taylor polynomial  $T_3$  in Figure 3 is a good approximation to  $\sin x$  near  $\pi/3$  but not as accurate near 0. Compare it with the third Maclaurin polynomial  $T_3$  in Figure 2, where the opposite is true.

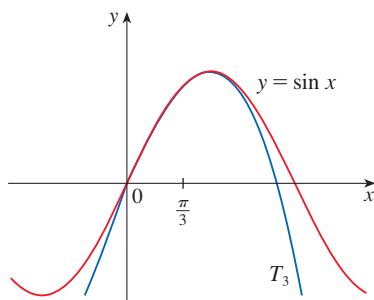

FIGURE 3

and this pattern repeats indefinitely. Therefore the Taylor series at  $\pi/3$  is

$$\begin{aligned}f\left(\frac{\pi}{3}\right) + \frac{f'\left(\frac{\pi}{3}\right)}{1!} \left(x - \frac{\pi}{3}\right) + \frac{f''\left(\frac{\pi}{3}\right)}{2!} \left(x - \frac{\pi}{3}\right)^2 + \frac{f'''\left(\frac{\pi}{3}\right)}{3!} \left(x - \frac{\pi}{3}\right)^3 + \dots \\ = \frac{\sqrt{3}}{2} + \frac{1}{2 \cdot 1!} \left(x - \frac{\pi}{3}\right) - \frac{\sqrt{3}}{2 \cdot 2!} \left(x - \frac{\pi}{3}\right)^2 - \frac{1}{2 \cdot 3!} \left(x - \frac{\pi}{3}\right)^3 + \dots\end{aligned}$$

The proof that this series represents  $\sin x$  for all  $x$  is very similar to that in Example 5. [Just replace  $x$  by  $x - \pi/3$  in (14).] We can write the series in sigma notation if we separate the terms that contain  $\sqrt{3}$ :

$$\sin x = \sum_{n=0}^{\infty} \frac{(-1)^n \sqrt{3}}{2(2n)!} \left(x - \frac{\pi}{3}\right)^{2n} + \sum_{n=0}^{\infty} \frac{(-1)^n}{2(2n+1)!} \left(x - \frac{\pi}{3}\right)^{2n+1}$$

**EXAMPLE 8** Find the Maclaurin series for  $f(x) = (1 + x)^k$ , where  $k$  is any real number.

**SOLUTION** We start by computing derivatives:

$$\begin{array}{ll} f(x) = (1 + x)^k & f(0) = 1 \\ f'(x) = k(1 + x)^{k-1} & f'(0) = k \\ f''(x) = k(k - 1)(1 + x)^{k-2} & f''(0) = k(k - 1) \\ f'''(x) = k(k - 1)(k - 2)(1 + x)^{k-3} & f'''(0) = k(k - 1)(k - 2) \\ \vdots & \vdots \\ f^{(n)}(x) = k(k - 1) \cdots (k - n + 1)(1 + x)^{k-n} & f^{(n)}(0) = k(k - 1) \cdots (k - n + 1) \end{array}$$

Therefore the Maclaurin series of  $f(x) = (1 + x)^k$  is

$$\sum_{n=0}^{\infty} \frac{f^{(n)}(0)}{n!} x^n = \sum_{n=0}^{\infty} \frac{k(k - 1) \cdots (k - n + 1)}{n!} x^n$$

This series is called the **binomial series**. Notice that if  $k$  is a nonnegative integer, then the terms are eventually 0 and so the series is finite. For other values of  $k$  none of the terms is 0 and so we can investigate the convergence of the series by using the Ratio Test. If the  $n$ th term is  $a_n$ , then

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \left| \frac{k(k - 1) \cdots (k - n + 1)(k - n)x^{n+1}}{(n + 1)!} \cdot \frac{n!}{k(k - 1) \cdots (k - n + 1)x^n} \right| \\ &= \frac{|k - n|}{n + 1} |x| = \frac{\left| 1 - \frac{k}{n} \right|}{1 + \frac{1}{n}} |x| \rightarrow |x| \quad \text{as } n \rightarrow \infty \end{aligned}$$

Thus, by the Ratio Test, the binomial series converges if  $|x| < 1$  and diverges if  $|x| > 1$ . ■

The traditional notation for the coefficients in the binomial series is

$$\binom{k}{n} = \frac{k(k - 1)(k - 2) \cdots (k - n + 1)}{n!}$$

and these numbers are called the **binomial coefficients**.

The following theorem states that  $(1 + x)^k$  is equal to the sum of its Maclaurin series. It is possible to prove this by showing that the remainder term  $R_n(x)$  approaches 0, but that turns out to be quite difficult. The proof outlined in Exercise 97 is much easier.

**17 The Binomial Series** If  $k$  is any real number and  $|x| < 1$ , then

$$(1 + x)^k = \sum_{n=0}^{\infty} \binom{k}{n} x^n = 1 + kx + \frac{k(k - 1)}{2!} x^2 + \frac{k(k - 1)(k - 2)}{3!} x^3 + \dots$$

Although the binomial series always converges when  $|x| < 1$ , the question of whether or not it converges at the endpoints,  $\pm 1$ , depends on the value of  $k$ . It turns out that the series converges at 1 if  $-1 < k \leq 0$  and at both endpoints if  $k \geq 0$ . Notice that if  $k$  is a positive integer and  $n > k$ , then the expression for  $\binom{k}{n}$  contains a factor  $(k - k)$ , so  $\binom{k}{n} = 0$ .

for  $n > k$ . This means that the series terminates and reduces to the ordinary Binomial Theorem when  $k$  is a positive integer. (See Reference Page 1.)

**EXAMPLE 9** For the function  $f(x) = \frac{1}{\sqrt{4-x}}$ , find the Maclaurin series and its radius of convergence.

**SOLUTION** We rewrite  $f(x)$  in a form where we can use the binomial series:

$$\frac{1}{\sqrt{4-x}} = \frac{1}{\sqrt{4\left(1 - \frac{x}{4}\right)}} = \frac{1}{2\sqrt{1 - \frac{x}{4}}} = \frac{1}{2} \left(1 - \frac{x}{4}\right)^{-1/2}$$

Using the binomial series with  $k = -\frac{1}{2}$  and with  $x$  replaced by  $-x/4$ , we have

$$\begin{aligned} \frac{1}{\sqrt{4-x}} &= \frac{1}{2} \left(1 - \frac{x}{4}\right)^{-1/2} = \frac{1}{2} \sum_{n=0}^{\infty} \binom{-\frac{1}{2}}{n} \left(-\frac{x}{4}\right)^n \\ &= \frac{1}{2} \left[ 1 + \left(-\frac{1}{2}\right) \left(-\frac{x}{4}\right) + \frac{(-\frac{1}{2})(-\frac{3}{2})}{2!} \left(-\frac{x}{4}\right)^2 + \frac{(-\frac{1}{2})(-\frac{3}{2})(-\frac{5}{2})}{3!} \left(-\frac{x}{4}\right)^3 \right. \\ &\quad \left. + \dots + \frac{(-\frac{1}{2})(-\frac{3}{2})(-\frac{5}{2}) \cdots (-\frac{1}{2} - n + 1)}{n!} \left(-\frac{x}{4}\right)^n + \dots \right] \\ &= \frac{1}{2} \left[ 1 + \frac{1}{8}x + \frac{1 \cdot 3}{2!8^2}x^2 + \frac{1 \cdot 3 \cdot 5}{3!8^3}x^3 + \dots + \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{n!8^n}x^n + \dots \right] \end{aligned}$$

We know from (17) that this series converges when  $|-x/4| < 1$ , that is,  $|x| < 4$ , so the radius of convergence is  $R = 4$ . ■

For future reference we collect in the following table some important Maclaurin series that we have derived in this section and in Section 11.9.

**Table 1**  
Important Maclaurin Series  
and Their Radii of  
Convergence

$\frac{1}{1-x} = \sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + \dots$	$R = 1$
$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$	$R = \infty$
$\sin x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$	$R = \infty$
$\cos x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots$	$R = \infty$
$\tan^{-1} x = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2n+1} = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$	$R = 1$
$\ln(1+x) = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n} = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$	$R = 1$
$(1+x)^k = \sum_{n=0}^{\infty} \binom{k}{n} x^n = 1 + kx + \frac{k(k-1)}{2!}x^2 + \frac{k(k-1)(k-2)}{3!}x^3 + \dots$	$R = 1$

### ■ New Taylor Series from Old

As we observed in Note 2, if a function has a power series representation at  $a$ , then the series is uniquely determined. That is, no matter how a power series representation for a function  $f$  is obtained, it must be the Taylor series of  $f$ . So, we can obtain new Taylor series representations by manipulating series from Table 1, rather than using the coefficient formula given in Theorem 5.

As we saw in the examples of Section 11.9, we can replace  $x$  in a given Taylor series by an expression of the form  $cx^m$ , we can multiply (or divide) the series by such an expression, and we can differentiate or integrate term by term (Theorem 11.9.2). It can be shown that we can also obtain new Taylor series by adding, subtracting, multiplying, or dividing Taylor series.

**EXAMPLE 10** Find the Maclaurin series for (a)  $f(x) = x \cos x$  and (b)  $f(x) = \ln(1 + 3x^2)$ .

#### SOLUTION

(a) We multiply the Maclaurin series for  $\cos x$  (see Table 1) by  $x$ :

$$x \cos x = x \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!} = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n)!} \quad \text{for all } x$$

(b) Replacing  $x$  by  $3x^2$  in the Maclaurin series for  $\ln(1 + x)$  gives

$$\ln(1 + 3x^2) = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{(3x^2)^n}{n} = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{3^n x^{2n}}{n}$$

We know from Table 1 that this series converges for  $|3x^2| < 1$ , that is  $|x| < 1/\sqrt{3}$ , so the radius of convergence is  $R = 1/\sqrt{3}$ . ■

**EXAMPLE 11** Find the function represented by the power series  $\sum_{n=0}^{\infty} (-1)^n \frac{2^n x^n}{n!}$ .

#### SOLUTION

By writing

$$\sum_{n=0}^{\infty} (-1)^n \frac{2^n x^n}{n!} = \sum_{n=0}^{\infty} \frac{(-2x)^n}{n!}$$

we see that this series is obtained by replacing  $x$  with  $-2x$  in the series for  $e^x$  (in Table 1). Thus the series represents the function  $e^{-2x}$ . ■

**EXAMPLE 12** Find the sum of the series  $\frac{1}{1 \cdot 2} - \frac{1}{2 \cdot 2^2} + \frac{1}{3 \cdot 2^3} - \frac{1}{4 \cdot 2^4} + \dots$

**SOLUTION** With sigma notation we can write the given series as

$$\sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n \cdot 2^n} = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{\left(\frac{1}{2}\right)^n}{n}$$

Then from Table 1 we see that this series matches the entry for  $\ln(1 + x)$  with  $x = \frac{1}{2}$ . So

$$\sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n \cdot 2^n} = \ln\left(1 + \frac{1}{2}\right) = \ln \frac{3}{2} \quad \blacksquare$$

One reason that Taylor series are important is that they enable us to integrate functions that we couldn't previously handle. In fact, in the introduction to this chapter we mentioned that Newton often integrated functions by first expressing them as power series and

then integrating the series term by term. The function  $f(x) = e^{-x^2}$  can't be integrated by techniques discussed so far because its antiderivative is not an elementary function (see Section 7.5). In the following example we use Newton's idea to integrate this function.

### EXAMPLE 13

- Evaluate  $\int e^{-x^2} dx$  as an infinite series.
- Evaluate  $\int_0^1 e^{-x^2} dx$  correct to within an error of 0.001.

### SOLUTION

(a) First we find the Maclaurin series for  $f(x) = e^{-x^2}$ . Although it's possible to use the direct method, let's find it by simply replacing  $x$  with  $-x^2$  in the series for  $e^x$  given in Table 1. Thus, for all values of  $x$ ,

$$e^{-x^2} = \sum_{n=0}^{\infty} \frac{(-x^2)^n}{n!} = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{n!} = 1 - \frac{x^2}{1!} + \frac{x^4}{2!} - \frac{x^6}{3!} + \dots$$

Now we integrate term by term:

$$\begin{aligned} \int e^{-x^2} dx &= \int \left( 1 - \frac{x^2}{1!} + \frac{x^4}{2!} - \frac{x^6}{3!} + \dots + (-1)^n \frac{x^{2n}}{n!} + \dots \right) dx \\ &= C + x - \frac{x^3}{3 \cdot 1!} + \frac{x^5}{5 \cdot 2!} - \frac{x^7}{7 \cdot 3!} + \dots + (-1)^n \frac{x^{2n+1}}{(2n+1)n!} + \dots \end{aligned}$$

This series converges for all  $x$  because the original series for  $e^{-x^2}$  converges for all  $x$ .

- The Fundamental Theorem of Calculus gives

$$\begin{aligned} \int_0^1 e^{-x^2} dx &= \left[ x - \frac{x^3}{3 \cdot 1!} + \frac{x^5}{5 \cdot 2!} - \frac{x^7}{7 \cdot 3!} + \frac{x^9}{9 \cdot 4!} - \dots \right]_0^1 \\ &= 1 - \frac{1}{3} + \frac{1}{10} - \frac{1}{42} + \frac{1}{216} - \dots \approx 1 - \frac{1}{3} + \frac{1}{10} - \frac{1}{42} + \frac{1}{216} \approx 0.7475 \end{aligned}$$

We can take  $C = 0$  in the antiderivative in part (a).

The Alternating Series Estimation Theorem shows that the error involved in this approximation is less than

$$\frac{1}{11 \cdot 5!} = \frac{1}{1320} < 0.001$$

Taylor series can also be used to evaluate limits, as illustrated in the next example. (Some mathematical software computes limits in this way.)

**EXAMPLE 14** Evaluate  $\lim_{x \rightarrow 0} \frac{e^x - 1 - x}{x^2}$ .

**SOLUTION** Using the Maclaurin series for  $e^x$  from Table 1, we see that the Maclaurin series for  $(e^x - 1 - x)/x^2$  is

$$\begin{aligned} \frac{e^x - 1 - x}{x^2} &= \left[ \left( 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \right) - 1 - x \right] / x^2 \\ &= \frac{1}{x^2} \left( \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots \right) = \frac{1}{2!} + \frac{x}{3!} + \frac{x^2}{4!} + \dots \end{aligned}$$

The limit in Example 14 could also be computed using l'Hospital's Rule.

Thus

$$\begin{aligned}\lim_{x \rightarrow 0} \frac{e^x - 1 - x}{x^2} &= \lim_{x \rightarrow 0} \left( \frac{1}{2!} + \frac{x}{3!} + \frac{x^2}{4!} + \dots \right) \\ &= \frac{1}{2!} + 0 + 0 + \dots = \frac{1}{2}\end{aligned}$$

because power series are continuous functions. ■

### Multiplication and Division of Power Series

If power series are added or subtracted, they behave like polynomials (Theorem 11.2.8 shows this). In fact, as the following example illustrates, they can also be multiplied and divided like polynomials. We find only the first few terms because the calculations for the later terms become tedious and the initial terms are the most important ones.

**EXAMPLE 15** Find the first three nonzero terms in the Maclaurin series for (a)  $e^x \sin x$  and (b)  $\tan x$ .

#### SOLUTION

(a) Using the Maclaurin series for  $e^x$  and  $\sin x$  in Table 1, we have

$$e^x \sin x = \left( 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \right) \left( x - \frac{x^3}{3!} + \dots \right)$$

We multiply these expressions, collecting like terms just as for polynomials:

$$\begin{array}{r} 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 + \dots \\ \times \quad x \quad - \frac{1}{6}x^3 + \dots \\ \hline x + x^2 + \frac{1}{2}x^3 + \frac{1}{6}x^4 + \dots \\ + \quad \quad \quad - \frac{1}{6}x^3 - \frac{1}{6}x^4 - \dots \\ \hline x + x^2 + \frac{1}{3}x^3 + \dots \end{array}$$

Thus

$$e^x \sin x = x + x^2 + \frac{1}{3}x^3 + \dots$$

(b) Using the Maclaurin series in Table 1, we have

$$\tan x = \frac{\sin x}{\cos x} = \frac{x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots}{1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots}$$

We use a procedure like long division:

$$\begin{array}{r} x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \dots \\ 1 - \frac{1}{2}x^2 + \frac{1}{24}x^4 - \dots \overline{)x - \frac{1}{6}x^3 + \frac{1}{120}x^5 - \dots} \\ x - \frac{1}{2}x^3 + \frac{1}{24}x^5 - \dots \\ \hline \frac{1}{3}x^3 - \frac{1}{30}x^5 + \dots \\ \frac{1}{3}x^3 - \frac{1}{6}x^5 + \dots \\ \hline \frac{2}{15}x^5 + \dots \end{array}$$

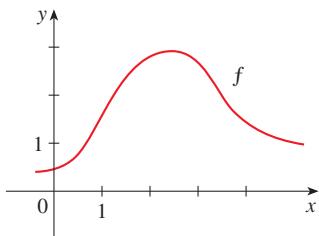

Thus

$$\tan x = x + \frac{1}{3}x^3 + \frac{2}{15}x^5 + \dots$$

Although we have not attempted to justify the formal manipulations that were used in Example 15, they are legitimate. There is a theorem which states that if both  $f(x) = \sum c_n x^n$  and  $g(x) = \sum b_n x^n$  converge for  $|x| < R$  and the series are multiplied as if they were polynomials, then the resulting series also converges for  $|x| < R$  and represents  $f(x)g(x)$ . For division we require  $b_0 \neq 0$ ; the resulting series converges for sufficiently small  $|x|$ .

## 11.10 Exercises

1. If  $f(x) = \sum_{n=0}^{\infty} b_n(x - 5)^n$  for all  $x$ , write a formula for  $b_8$ .  
 2. The graph of  $f$  is shown.

- (a) Explain why the series  $1.1 + 0.7x^2 + 2.2x^3 + \dots$  is not the Maclaurin series of  $f$ .  
 (b) Explain why the series

$$1.6 - 0.8(x - 1) + 0.4(x - 1)^2 - 0.1(x - 1)^3 + \dots$$

is not the Taylor series of  $f$  centered at 1.

- (c) Explain why the series

$$2.8 + 0.5(x - 2) + 1.5(x - 2)^2 - 0.1(x - 2)^3 + \dots$$

is not the Taylor series of  $f$  centered at 2.

3. If  $f^{(n)}(0) = (n + 1)!$  for  $n = 0, 1, 2, \dots$ , find the Maclaurin series for  $f$  and its radius of convergence.

4. Find the Taylor series for  $f$  centered at 4 if

$$f^{(n)}(4) = \frac{(-1)^n n!}{3^n(n + 1)}$$

What is the radius of convergence of the Taylor series?

- 5–10** Use the definition of a Taylor series to find the first four nonzero terms of the series for  $f(x)$  centered at the given value of  $a$ .

5.  $f(x) = xe^x, a = 0$       6.  $f(x) = \frac{1}{1+x}, a = 2$   
 7.  $f(x) = \sqrt[3]{x}, a = 8$       8.  $f(x) = \ln x, a = 1$   
 9.  $f(x) = \sin x, a = \pi/6$       10.  $f(x) = \cos^2 x, a = 0$

- 11–20** Find the Maclaurin series for  $f(x)$  using the definition of a Maclaurin series. [Assume that  $f$  has a power series expansion. Do not show that  $R_n(x) \rightarrow 0$ .] Also find the associated radius of convergence.

11.  $f(x) = (1 - x)^{-2}$       12.  $f(x) = \ln(1 + x)$

13.  $f(x) = \cos x$       14.  $f(x) = e^{-2x}$   
 15.  $f(x) = 2x^4 - 3x^2 + 3$       16.  $f(x) = \sin 3x$   
 17.  $f(x) = 2^x$       18.  $f(x) = x \cos x$   
 19.  $f(x) = \sinh x$       20.  $f(x) = \cosh x$

- 21–30** Find the Taylor series for  $f(x)$  centered at the given value of  $a$ . [Assume that  $f$  has a power series expansion. Do not show that  $R_n(x) \rightarrow 0$ .] Also find the associated radius of convergence.

21.  $f(x) = x^5 + 2x^3 + x, a = 2$   
 22.  $f(x) = x^6 - x^4 + 2, a = -2$   
 23.  $f(x) = \ln x, a = 2$       24.  $f(x) = 1/x, a = -3$   
 25.  $f(x) = e^{2x}, a = 3$       26.  $f(x) = 1/x^2, a = 1$   
 27.  $f(x) = \sin x, a = \pi$       28.  $f(x) = \cos x, a = \pi/2$   
 29.  $f(x) = \sin 2x, a = \pi$       30.  $f(x) = \sqrt{x}, a = 16$

31. Prove that the series obtained in Exercise 13 represents  $\cos x$  for all  $x$ .  
 32. Prove that the series obtained in Exercise 27 represents  $\sin x$  for all  $x$ .  
 33. Prove that the series obtained in Exercise 19 represents  $\sinh x$  for all  $x$ .  
 34. Prove that the series obtained in Exercise 20 represents  $\cosh x$  for all  $x$ .

- 35–38** Use the binomial series to expand the given function as a power series. State the radius of convergence.

35.  $\sqrt[4]{1 - x}$       36.  $\sqrt[3]{8 + x}$   
 37.  $\frac{1}{(2 + x)^3}$       38.  $(1 - x)^{3/4}$

- 39–48** Use a Maclaurin series in Table 1 to obtain the Maclaurin series for the given function.
39.  $f(x) = \arctan(x^2)$       40.  $f(x) = \sin(\pi x/4)$   
 41.  $f(x) = x \cos 2x$       42.  $f(x) = e^{3x} - e^{2x}$   
 43.  $f(x) = x \cos(\frac{1}{2}x^2)$       44.  $f(x) = x^2 \ln(1 + x^3)$

45.  $f(x) = \frac{x}{\sqrt{4+x^2}}$

46.  $f(x) = \frac{x^2}{\sqrt{2+x}}$

47.  $f(x) = \sin^2 x$  [Hint: Use  $\sin^2 x = \frac{1}{2}(1 - \cos 2x)$ .]

48.  $f(x) = \begin{cases} \frac{x - \sin x}{x^3} & \text{if } x \neq 0 \\ \frac{1}{6} & \text{if } x = 0 \end{cases}$

49. Use the definitions

$$\sinh x = \frac{e^x - e^{-x}}{2} \quad \cosh x = \frac{e^x + e^{-x}}{2}$$

and the Maclaurin series for  $e^x$  to show that

(a)  $\sinh x = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{(2n+1)!}$

(b)  $\cosh x = \sum_{n=0}^{\infty} \frac{x^{2n}}{(2n)!}$

50. Use the formula

$$\tanh^{-1} x = \frac{1}{2} \ln \left( \frac{1+x}{1-x} \right) \quad -1 < x < 1$$

and the Maclaurin series for  $\ln(1+x)$  to show that

$$\tanh^{-1} x = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{2n+1}$$

 51–54 Find the Maclaurin series of  $f$  (by any method) and the associated radius of convergence. Graph  $f$  and its first few Taylor polynomials on the same screen. What do you notice about the relationship between these polynomials and  $f$ ?

51.  $f(x) = \cos(x^2)$

52.  $f(x) = \ln(1+x^2)$

53.  $f(x) = xe^{-x}$

54.  $f(x) = \tan^{-1}(x^3)$

55. Use the Maclaurin series for  $\cos x$  to compute  $\cos 5^\circ$  correct to five decimal places.

56. Use the Maclaurin series for  $e^x$  to calculate  $1/\sqrt[10]{e}$  correct to five decimal places.

57. (a) Use the binomial series to expand  $1/\sqrt{1-x^2}$ .  
 (b) Use part (a) to find the Maclaurin series for  $\sin^{-1} x$ .

58. (a) Expand  $1/\sqrt[4]{1+x}$  as a power series.  
 (b) Use part (a) to estimate  $1/\sqrt[4]{1.1}$  correct to three decimal places.

59–62 Evaluate the indefinite integral as an infinite series.

59.  $\int \sqrt{1+x^3} dx$

60.  $\int x^2 \sin(x^2) dx$

61.  $\int \frac{\cos x - 1}{x} dx$

62.  $\int \arctan(x^2) dx$

63–66 Use series to approximate the definite integral to within the indicated accuracy.

63.  $\int_0^{1/2} x^3 \arctan x dx$  (four decimal places)

64.  $\int_0^1 \sin(x^4) dx$  (four decimal places)

65.  $\int_0^{0.4} \sqrt{1+x^4} dx$  ( $|\text{error}| < 5 \times 10^{-6}$ )

66.  $\int_0^{0.5} x^2 e^{-x^2} dx$  ( $|\text{error}| < 0.001$ )

67–71 Use series to evaluate the limit.

67.  $\lim_{x \rightarrow 0} \frac{x - \ln(1+x)}{x^2}$

68.  $\lim_{x \rightarrow 0} \frac{1 - \cos x}{1+x - e^x}$

69.  $\lim_{x \rightarrow 0} \frac{\sin x - x + \frac{1}{6}x^3}{x^5}$

70.  $\lim_{x \rightarrow 0} \frac{\sqrt{1+x} - 1 - \frac{1}{2}x}{x^2}$

71.  $\lim_{x \rightarrow 0} \frac{x^3 - 3x + 3 \tan^{-1} x}{x^5}$

72. Use the series in Example 15(b) to evaluate

$$\lim_{x \rightarrow 0} \frac{\tan x - x}{x^3}$$

We found this limit in Example 4.4.4 using l'Hospital's Rule three times. Which method do you prefer?

73–78 Use multiplication or division of power series to find the first three nonzero terms in the Maclaurin series for each function.

73.  $y = e^{-x^2} \cos x$

74.  $y = \sec x$

75.  $y = \frac{x}{\sin x}$

76.  $y = e^x \ln(1+x)$

77.  $y = (\arctan x)^2$

78.  $y = e^x \sin^2 x$

79–82 Find the function represented by the given power series.

79.  $\sum_{n=0}^{\infty} (-1)^n \frac{x^{4n}}{n!}$

80.  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^{4n}}{n}$

81.  $\sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2^{2n+1}(2n+1)}$

82.  $\sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{2^{2n+1}(2n+1)!}$

83–90 Find the sum of the series.

83.  $\sum_{n=0}^{\infty} \frac{(-1)^n}{n!}$

84.  $\sum_{n=0}^{\infty} \frac{(-1)^n \pi^{2n}}{6^{2n}(2n)!}$

85.  $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{3^n}{n 5^n}$

86.  $\sum_{n=0}^{\infty} \frac{3^n}{5^n n!}$

87.  $\sum_{n=0}^{\infty} \frac{(-1)^n \pi^{2n+1}}{4^{2n+1}(2n+1)!}$

88.  $1 - \ln 2 + \frac{(\ln 2)^2}{2!} - \frac{(\ln 2)^3}{3!} + \dots$

89.  $3 + \frac{9}{2!} + \frac{27}{3!} + \frac{81}{4!} + \dots$

90.  $\frac{1}{1 \cdot 2} - \frac{1}{3 \cdot 2^3} + \frac{1}{5 \cdot 2^5} - \frac{1}{7 \cdot 2^7} + \dots$

91. Show that if  $p$  is an  $n$ th-degree polynomial, then

$$p(x+1) = \sum_{i=0}^n \frac{p^{(i)}(x)}{i!}$$

92. Use the Maclaurin series for  $f(x) = x/(1+x^2)$  to find  $f^{(101)}(0)$ .

93. Use the Maclaurin series for  $f(x) = x \sin(x^2)$  to find  $f^{(203)}(0)$ .

94. If  $f(x) = (1+x^3)^{30}$ , what is  $f^{(58)}(0)$ ?

95. Prove Taylor's Inequality for  $n = 2$ , that is, prove that if  $|f'''(x)| \leq M$  for  $|x-a| \leq d$ , then

$$|R_2(x)| \leq \frac{M}{6} |x-a|^3 \quad \text{for } |x-a| \leq d$$

96. (a) Show that the function defined by

$$f(x) = \begin{cases} e^{-1/x^2} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

is not equal to its Maclaurin series.

- (b) Graph the function in part (a) and comment on its behavior near the origin.

97. Use the following steps to prove Theorem 17.

- (a) Let  $g(x) = \sum_{n=0}^{\infty} \binom{k}{n} x^n$ . Differentiate this series to show that

$$g'(x) = \frac{kg(x)}{1+x} \quad -1 < x < 1$$

- (b) Let  $h(x) = (1+x)^{-k} g(x)$  and show that  $h'(x) = 0$ .

- (c) Deduce that  $g(x) = (1+x)^k$ .

98. In Exercise 10.2.62 it was shown that the length of the ellipse  $x = a \sin \theta$ ,  $y = b \cos \theta$ , where  $a > b > 0$ , is

$$L = 4a \int_0^{\pi/2} \sqrt{1 - e^2 \sin^2 \theta} \, d\theta$$

where  $e = \sqrt{a^2 - b^2}/a$  is the eccentricity of the ellipse.

Expand the integrand as a binomial series and use the result of Exercise 7.1.56 to express  $L$  as a series in powers of the eccentricity up to the term in  $e^6$ .

## DISCOVERY PROJECT AN ELUSIVE LIMIT

This project deals with the function

$$f(x) = \frac{\sin(\tan x) - \tan(\sin x)}{\arcsin(\arctan x) - \arctan(\arcsin x)}$$

1. Use a computer algebra system to evaluate  $f(x)$  for  $x = 1, 0.1, 0.01, 0.001$ , and  $0.0001$ . (A calculator may not provide accurate values.) Does it appear that  $f$  has a limit as  $x \rightarrow 0$ ?
2. Use the CAS to graph  $f$  near  $x = 0$ . Does it appear that  $f$  has a limit as  $x \rightarrow 0$ ?
3. Try to evaluate  $\lim_{x \rightarrow 0} f(x)$  with l'Hospital's Rule, using the CAS to find derivatives of the numerator and denominator. What do you discover? How many applications of l'Hospital's Rule are required?
4. Evaluate  $\lim_{x \rightarrow 0} f(x)$  by using the CAS to find sufficiently many terms in the Taylor series of the numerator and denominator.
5. Use the limit command on the CAS to find  $\lim_{x \rightarrow 0} f(x)$  directly. (Most computer algebra systems use the method of Problem 4 to compute limits.)
6. In view of the answers to Problems 4 and 5, how do you explain the results of Problems 1 and 2?

**WRITING PROJECT****HOW NEWTON DISCOVERED THE BINOMIAL SERIES**

The Binomial Theorem, which gives the expansion of  $(a + b)^k$ , was known to Chinese mathematicians many centuries before the time of Newton for the case where the exponent  $k$  is a positive integer. In 1665, when he was 22, Newton was the first to discover the infinite series expansion of  $(a + b)^k$  when  $k$  is a fractional exponent (positive or negative). He didn't publish his discovery, but he stated it and gave examples of how to use it in a letter (now called the *epistola prior*) dated June 13, 1676, that he sent to Henry Oldenburg, secretary of the Royal Society of London, to transmit to Leibniz. When Leibniz replied, he asked how Newton had discovered the binomial series. Newton wrote a second letter, the *epistola posterior* of October 24, 1676, in which he explained in great detail how he arrived at his discovery by a very indirect route. He was investigating the areas under the curves  $y = (1 - x^2)^{n/2}$  from 0 to  $x$  for  $n = 0, 1, 2, 3, 4, \dots$ . These are easy to calculate if  $n$  is even. By observing patterns and interpolating, Newton was able to guess the answers for odd values of  $n$ . Then he realized he could get the same answers by expressing  $(1 - x^2)^{n/2}$  as an infinite series.

Write an essay on Newton's discovery of the binomial series. Start by giving the statement of the binomial series in Newton's notation (see the *epistola prior* on page 285 of [4] or page 402 of [2]). Explain why Newton's version is equivalent to Theorem 11.10.17. Then read Newton's *epistola posterior* (page 287 in [4] or page 404 in [2]) and explain the patterns that Newton discovered in the areas under the curves  $y = (1 - x^2)^{n/2}$ . Show how he was able to guess the areas under the remaining curves and how he verified his answers. Finally, explain how these discoveries led to the binomial series. The books by Edwards [1] and Katz [3] contain commentaries on Newton's letters.

**11.11****Applications of Taylor Polynomials**

In this section we explore two types of applications of Taylor polynomials. First we look at how they are used to approximate functions—computer scientists employ them because polynomials are the simplest of functions. Then we investigate how physicists and engineers use them in such fields as relativity, optics, blackbody radiation, electric dipoles, the velocity of water waves, and building highways across a desert.

### Approximating Functions by Polynomials

Suppose that  $f(x)$  is equal to the sum of its Taylor series at  $a$ :

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x - a)^n$$

In Section 11.10 we introduced the notation  $T_n(x)$  for the  $n$ th partial sum of this series and called it the  $n$ th-degree Taylor polynomial of  $f$  at  $a$ . Thus

$$\begin{aligned} T_n(x) &= \sum_{i=0}^n \frac{f^{(i)}(a)}{i!} (x - a)^i \\ &= f(a) + \frac{f'(a)}{1!} (x - a) + \frac{f''(a)}{2!} (x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!} (x - a)^n \end{aligned}$$

Since  $f$  is the sum of its Taylor series, we know that  $T_n(x) \rightarrow f(x)$  as  $n \rightarrow \infty$  and so  $T_n$  can be used as an approximation to  $f$ :  $f(x) \approx T_n(x)$ .

Notice that the first-degree Taylor polynomial

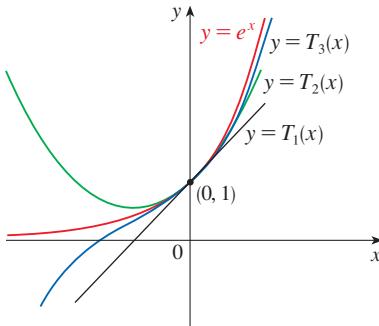

FIGURE 1

is the same as the linearization of  $f$  at  $a$  that we discussed in Section 3.10. Notice also that  $T_1$  and its derivative have the same values at  $a$  that  $f$  and  $f'$  have. In general, it can be shown that the derivatives of  $T_n$  at  $a$  agree with those of  $f$  up to and including derivatives of order  $n$ .

To illustrate these ideas let's take another look at the graphs of  $y = e^x$  and its first few Taylor polynomials, as shown in Figure 1. The graph of  $T_1$  is the tangent line to  $y = e^x$  at  $(0, 1)$ ; this tangent line is the best linear approximation to  $e^x$  near  $(0, 1)$ . The graph of  $T_2$  is the parabola  $y = 1 + x + x^2/2$ , and the graph of  $T_3$  is the cubic curve  $y = 1 + x + x^2/2 + x^3/6$ , which is a closer fit to the exponential curve  $y = e^x$  than  $T_2$ . The next Taylor polynomial  $T_4$  would be an even better approximation, and so on.

The values in the table give a numerical demonstration of the convergence of the Taylor polynomials  $T_n(x)$  to the function  $y = e^x$ . We see that when  $x = 0.2$  the convergence is very rapid, but when  $x = 3$  it is somewhat slower. In fact, the farther  $x$  is from 0, the more slowly  $T_n(x)$  converges to  $e^x$ .

When using a Taylor polynomial  $T_n$  to approximate a function  $f$ , we have to ask the questions: How good an approximation is it? How large should we take  $n$  to be in order to achieve a desired accuracy? To answer these questions we need to look at the absolute value of the remainder:

$$|R_n(x)| = |f(x) - T_n(x)|$$

There are three possible methods for estimating the size of the error:

1. We can use a calculator or computer to graph  $|R_n(x)| = |f(x) - T_n(x)|$  and thereby estimate the error.
2. If the series happens to be an alternating series, we can use the Alternating Series Estimation Theorem.
3. In all cases we can use Taylor's Inequality (Theorem 11.10.9), which says that if  $|f^{(n+1)}(x)| \leq M$ , then

$$|R_n(x)| \leq \frac{M}{(n+1)!} |x - a|^{n+1}$$

### EXAMPLE 1

- Approximate the function  $f(x) = \sqrt[3]{x}$  by a Taylor polynomial of degree 2 at  $a = 8$ .
- How accurate is this approximation when  $7 \leq x \leq 9$ ?

**SOLUTION**

(a)

$$f(x) = \sqrt[3]{x} = x^{1/3} \quad f(8) = 2$$

$$f'(x) = \frac{1}{3}x^{-2/3} \quad f'(8) = \frac{1}{12}$$

$$f''(x) = -\frac{2}{9}x^{-5/3} \quad f''(8) = \frac{1}{144}$$

$$f'''(x) = \frac{10}{27}x^{-8/3}$$

Thus the second-degree Taylor polynomial is

$$\begin{aligned} T_2(x) &= f(8) + \frac{f'(8)}{1!}(x - 8) + \frac{f''(8)}{2!}(x - 8)^2 \\ &= 2 + \frac{1}{12}(x - 8) - \frac{1}{288}(x - 8)^2 \end{aligned}$$

The desired approximation is

$$\sqrt[3]{x} \approx T_2(x) = 2 + \frac{1}{12}(x - 8) - \frac{1}{288}(x - 8)^2$$

(b) The Taylor series is not alternating when  $x < 8$ , so we can't use the Alternating Series Estimation Theorem in this example. But we can use Taylor's Inequality with  $n = 2$  and  $a = 8$ :

$$|R_2(x)| \leq \frac{M}{3!}|x - 8|^3$$

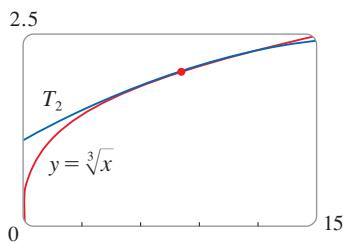

where  $|f'''(x)| \leq M$ . Because  $x \geq 7$ , we have  $x^{8/3} \geq 7^{8/3}$  and so

$$f'''(x) = \frac{10}{27} \cdot \frac{1}{x^{8/3}} \leq \frac{10}{27} \cdot \frac{1}{7^{8/3}} < 0.0021$$

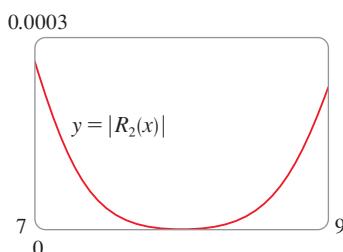

Therefore we can take  $M = 0.0021$ . Also  $7 \leq x \leq 9$ , so  $-1 \leq x - 8 \leq 1$  and  $|x - 8| \leq 1$ . Then Taylor's Inequality gives

$$|R_2(x)| \leq \frac{0.0021}{3!} \cdot 1^3 = \frac{0.0021}{6} < 0.0004$$

Thus, if  $7 \leq x \leq 9$ , the approximation in part (a) is accurate to within 0.0004. ■

**FIGURE 2**

**FIGURE 3**

Let's check the calculation in Example 1 graphically. Figure 2 shows that the graphs of  $y = \sqrt[3]{x}$  and  $y = T_2(x)$  are very close to each other when  $x$  is near 8. Figure 3 shows the graph of  $|R_2(x)|$  computed from the expression

$$|R_2(x)| = |\sqrt[3]{x} - T_2(x)|$$

We see from the graph that

$$|R_2(x)| < 0.0003$$

when  $7 \leq x \leq 9$ . Thus the error estimate from graphical methods is slightly better than the error estimate from Taylor's Inequality in this case.

**EXAMPLE 2**

(a) What is the maximum error possible in using the approximation

$$\sin x \approx x - \frac{x^3}{3!} + \frac{x^5}{5!}$$

when  $-0.3 \leq x \leq 0.3$ ? Use this approximation to find  $\sin 12^\circ$  correct to six decimal places.

(b) For what values of  $x$  is this approximation accurate to within 0.00005?

**SOLUTION**

(a) Notice that the Maclaurin series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$$

is alternating for all nonzero values of  $x$ , and the successive terms decrease in size because  $|x| < 1$ , so we can use the Alternating Series Estimation Theorem. The error in approximating  $\sin x$  by the first three terms of its Maclaurin series is at most

$$\left| \frac{x^7}{7!} \right| = \frac{|x|^7}{5040}$$

If  $-0.3 \leq x \leq 0.3$ , then  $|x| \leq 0.3$ , so the error is smaller than

$$\frac{(0.3)^7}{5040} \approx 4.3 \times 10^{-8}$$

To find  $\sin 12^\circ$  we first convert to radian measure:

$$\begin{aligned} \sin 12^\circ &= \sin\left(\frac{12\pi}{180}\right) = \sin\left(\frac{\pi}{15}\right) \\ &\approx \frac{\pi}{15} - \left(\frac{\pi}{15}\right)^3 \frac{1}{3!} + \left(\frac{\pi}{15}\right)^5 \frac{1}{5!} \approx 0.20791169 \end{aligned}$$

Thus, correct to six decimal places,  $\sin 12^\circ \approx 0.207912$ .

(b) The error will be smaller than 0.00005 if

$$\frac{|x|^7}{5040} < 0.00005$$

Solving this inequality for  $x$ , we get

$$|x|^7 < 0.252 \quad \text{or} \quad |x| < (0.252)^{1/7} \approx 0.821$$

So the given approximation is accurate to within 0.00005 when  $|x| < 0.82$ . ■

What if we use Taylor's Inequality to solve Example 2? Since  $f^{(7)}(x) = -\cos x$ , we have  $|f^{(7)}(x)| \leq 1$  and so

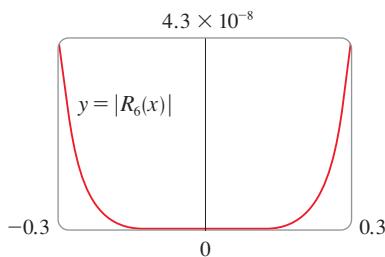

$$|R_6(x)| \leq \frac{1}{7!} |x|^7$$

So we get the same estimates as with the Alternating Series Estimation Theorem.

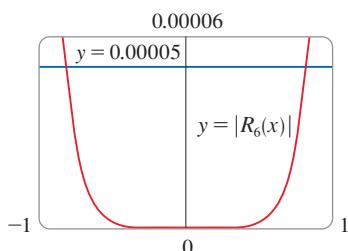

What about graphical methods? Figure 4 shows the graph of

$$|R_6(x)| = |\sin x - (x - \frac{1}{6}x^3 + \frac{1}{120}x^5)|$$

and we see from it that  $|R_6(x)| < 4.3 \times 10^{-8}$  when  $|x| \leq 0.3$ . This is the same estimate that we obtained in Example 2. For part (b) we want  $|R_6(x)| < 0.00005$ , so we graph both  $y = |R_6(x)|$  and  $y = 0.00005$  in Figure 5. From the coordinates of the right intersection point we find that the inequality is satisfied when  $|x| < 0.82$ . Again this is the same estimate that we obtained in the solution to Example 2.

**FIGURE 4**

**FIGURE 5**

If we had been asked to approximate  $\sin 72^\circ$  instead of  $\sin 12^\circ$  in Example 2, it would have been wise to use the Taylor polynomials at  $a = \pi/3$  (instead of  $a = 0$ ) because they are better approximations to  $\sin x$  for values of  $x$  close to  $\pi/3$ . Notice that  $72^\circ$  is close to  $60^\circ$  (or  $\pi/3$  radians) and the derivatives of  $\sin x$  are easy to compute at  $\pi/3$ .

Figure 6 shows the graphs of the Maclaurin polynomial approximations

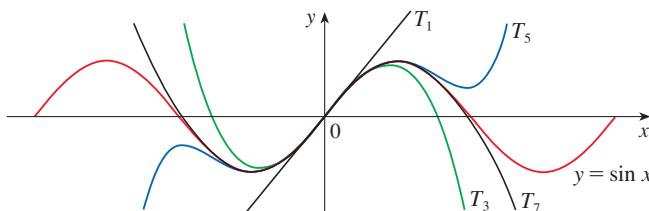

$$T_1(x) = x$$

$$T_3(x) = x - \frac{x^3}{3!}$$

$$T_5(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!}$$

$$T_7(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!}$$

to the sine curve. You can see that as  $n$  increases,  $T_n(x)$  is a good approximation to  $\sin x$  on a larger and larger interval.

**FIGURE 6**

One use of the type of calculation done in Examples 1 and 2 occurs in calculators and computers. For instance, when you press the  $\sin$  or  $e^x$  key on your calculator, or when a computer programmer uses a subroutine for a trigonometric or exponential or Bessel function, in many machines a polynomial approximation is calculated. The polynomial is often a Taylor polynomial that has been modified so that the error is spread more evenly throughout an interval.

### ■ Applications to Physics

Taylor polynomials are also used frequently in physics. In order to gain insight into an equation, a physicist often simplifies a function by considering only the first two or three terms in its Taylor series. In other words, the physicist uses a Taylor polynomial as an approximation to the function. Taylor's Inequality can then be used to gauge the accuracy of the approximation. The following example shows one way in which this idea is used in special relativity.

**EXAMPLE 3** In Einstein's theory of special relativity the mass  $m$  of an object moving with velocity  $v$  is

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

where  $m_0$  is the mass of the object when at rest and  $c$  is the speed of light. The kinetic energy  $k$  of the object is the difference between its total energy and its energy at rest:

$$K = mc^2 - m_0c^2$$

- (a) Show that when  $v$  is very small compared with  $c$ , this expression for  $K$  agrees with classical Newtonian physics:  $K = \frac{1}{2}m_0v^2$ .

- (b) Use Taylor's Inequality to estimate the difference in these expressions for  $K$  when  $|v| \leq 100$  m/s.

### SOLUTION

- (a) Using the expressions given for  $K$  and  $m$ , we get

$$K = mc^2 - m_0c^2 = \frac{m_0c^2}{\sqrt{1 - v^2/c^2}} - m_0c^2 = m_0c^2 \left[ \left( 1 - \frac{v^2}{c^2} \right)^{-1/2} - 1 \right]$$

The upper curve in Figure 7 is the graph of the expression for the kinetic energy  $K$  of an object with velocity  $v$  in special relativity. The lower curve shows the function used for  $K$  in classical Newtonian physics. When  $v$  is much smaller than the speed of light, the curves are practically identical.

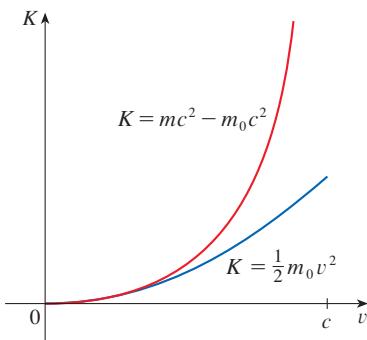

FIGURE 7

With  $x = -v^2/c^2$ , the Maclaurin series for  $(1 + x)^{-1/2}$  is most easily computed as a binomial series with  $k = -\frac{1}{2}$ . (Notice that  $|x| < 1$  because  $v < c$ .) Therefore we have

$$\begin{aligned} (1 + x)^{-1/2} &= 1 - \frac{1}{2}x + \frac{(-\frac{1}{2})(-\frac{3}{2})}{2!}x^2 + \frac{(-\frac{1}{2})(-\frac{3}{2})(-\frac{5}{2})}{3!}x^3 + \dots \\ &= 1 - \frac{1}{2}x + \frac{3}{8}x^2 - \frac{5}{16}x^3 + \dots \end{aligned}$$

and

$$\begin{aligned} K &= m_0c^2 \left[ \left( 1 + \frac{1}{2} \frac{v^2}{c^2} + \frac{3}{8} \frac{v^4}{c^4} + \frac{5}{16} \frac{v^6}{c^6} + \dots \right) - 1 \right] \\ &= m_0c^2 \left( \frac{1}{2} \frac{v^2}{c^2} + \frac{3}{8} \frac{v^4}{c^4} + \frac{5}{16} \frac{v^6}{c^6} + \dots \right) \end{aligned}$$

If  $v$  is much smaller than  $c$ , then all terms after the first are very small when compared with the first term. If we omit them, we get

$$K \approx m_0c^2 \left( \frac{1}{2} \frac{v^2}{c^2} \right) = \frac{1}{2} m_0 v^2$$

- (b) If  $x = -v^2/c^2$ ,  $f(x) = m_0c^2[(1 + x)^{-1/2} - 1]$ , and  $M$  is a number such that  $|f''(x)| \leq M$ , then we can use Taylor's Inequality to write

$$|R_1(x)| \leq \frac{M}{2!} x^2$$

We have  $f''(x) = \frac{3m_0c^2}{4(1 - v^2/c^2)^{5/2}}$  and we are given that  $|v| \leq 100$  m/s, so

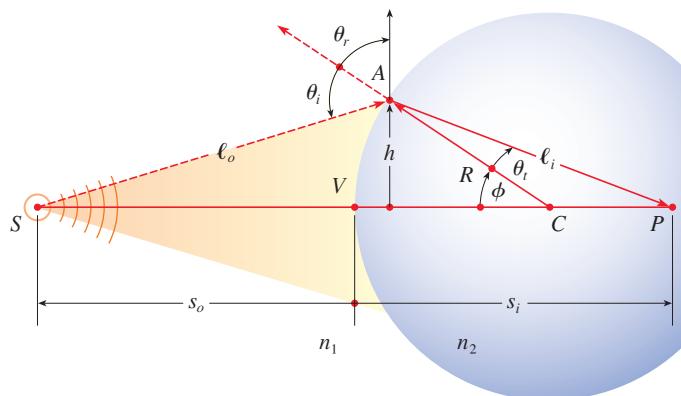

$$|f''(x)| = \frac{3m_0c^2}{4(1 - v^2/c^2)^{5/2}} \leq \frac{3m_0c^2}{4(1 - 100^2/c^2)^{5/2}} \quad (=M)$$

Thus, with  $c = 3 \times 10^8$  m/s,

$$|R_1(x)| \leq \frac{1}{2} \cdot \frac{3m_0c^2}{4(1 - 100^2/c^2)^{5/2}} \cdot \frac{100^4}{c^4} < (4.17 \times 10^{-10})m_0$$

So when  $|v| \leq 100$  m/s, the magnitude of the error in using the Newtonian expression for kinetic energy is at most  $(4.2 \times 10^{-10})m_0$ .

Another application to physics occurs in optics. Figure 8 depicts a wave from the point source  $S$  meeting a spherical interface of radius  $R$  centered at  $C$ . The ray  $SA$  is refracted toward  $P$ .

**FIGURE 8**

Refraction at a spherical interface

Using Fermat's principle that light travels so as to minimize the time taken, one can derive the equation

$$\boxed{1} \quad \frac{n_1}{\ell_o} + \frac{n_2}{\ell_i} = \frac{1}{R} \left( \frac{n_2 s_i}{\ell_i} - \frac{n_1 s_o}{\ell_o} \right)$$

where  $n_1$  and  $n_2$  are indexes of refraction and  $\ell_o$ ,  $\ell_i$ ,  $s_o$ , and  $s_i$  are the distances indicated in Figure 8. By the Law of Cosines, applied to triangles  $ACS$  and  $ACP$ , we have

$$\boxed{2} \quad \ell_o = \sqrt{R^2 + (s_o + R)^2 - 2R(s_o + R) \cos \phi}$$

$$\ell_i = \sqrt{R^2 + (s_i - R)^2 + 2R(s_i - R) \cos \phi}$$

Here we use the identity

$$\cos(\pi - \phi) = -\cos \phi$$

Because Equation 1 is cumbersome to work with, Gauss, in 1841, simplified it by using the linear approximation  $\cos \phi \approx 1$  for small values of  $\phi$ . (This amounts to using the Taylor polynomial of degree 1.) Then Equation 1 becomes the following simpler equation [as you are asked to show in Exercise 34(a)]:

$$\boxed{3} \quad \frac{n_1}{s_o} + \frac{n_2}{s_i} = \frac{n_2 - n_1}{R}$$

The resulting optical theory is known as *Gaussian optics*, or *first-order optics*, and has become the basic theoretical tool used to design lenses.

A more accurate theory is obtained by approximating  $\cos \phi$  by its Taylor polynomial of degree 3 (which is the same as the Taylor polynomial of degree 2). This takes into account rays for which  $\phi$  is not so small, that is, rays that strike the surface at greater distances  $h$  above the axis. In Exercise 34(b) you are asked to use this approximation to derive the more accurate equation

$$\boxed{4} \quad \frac{n_1}{s_o} + \frac{n_2}{s_i} = \frac{n_2 - n_1}{R} + h^2 \left[ \frac{n_1}{2s_o} \left( \frac{1}{s_o} + \frac{1}{R} \right)^2 + \frac{n_2}{2s_i} \left( \frac{1}{R} - \frac{1}{s_i} \right)^2 \right]$$

The resulting optical theory is known as *third-order optics*.

Other applications of Taylor polynomials to physics and engineering are explored in Exercises 32, 33, 35, 36, 37, and 38, and in the Applied Project following this section.

## 11.11 Exercises

- 1.** (a) Find the Taylor polynomials up to degree 5 for  $f(x) = \sin x$  centered at  $a = 0$ . Graph  $f$  and these polynomials on a common screen.  
 (b) Evaluate  $f$  and these polynomials at  $x = \pi/4, \pi/2$ , and  $\pi$ .  
 (c) Comment on how the Taylor polynomials converge to  $f(x)$ .
- 2.** (a) Find the Taylor polynomials up to degree 3 for  $f(x) = \tan x$  centered at  $a = 0$ . Graph  $f$  and these polynomials on a common screen.  
 (b) Evaluate  $f$  and these polynomials at  $x = \pi/6, \pi/4$ , and  $\pi/3$ .  
 (c) Comment on how the Taylor polynomials converge to  $f(x)$ .
- 3–10** Find the Taylor polynomial  $T_3(x)$  for the function  $f$  centered at the number  $a$ . Graph  $f$  and  $T_3$  on the same screen.
3.  $f(x) = e^x, a = 1$       4.  $f(x) = \sin x, a = \pi/6$   
 5.  $f(x) = \cos x, a = \pi/2$       6.  $f(x) = e^{-x} \sin x, a = 0$   
 7.  $f(x) = \ln x, a = 1$       8.  $f(x) = x \cos x, a = 0$   
 9.  $f(x) = xe^{-2x}, a = 0$       10.  $f(x) = \tan^{-1} x, a = 1$
- 11–12** Use a computer algebra system to find the Taylor polynomials  $T_n$  centered at  $a$  for  $n = 2, 3, 4, 5$ . Then graph these polynomials and  $f$  on the same screen.
11.  $f(x) = \cot x, a = \pi/4$   
 12.  $f(x) = \sqrt[3]{1 + x^2}, a = 0$
- 13–22**
- (a) Approximate  $f$  by a Taylor polynomial with degree  $n$  at the number  $a$ .  
 (b) Use Taylor's Inequality to estimate the accuracy of the approximation  $f(x) \approx T_n(x)$  when  $x$  lies in the given interval.  
 (c) Check your result in part (b) by graphing  $|R_n(x)|$ .
13.  $f(x) = 1/x, a = 1, n = 2, 0.7 \leq x \leq 1.3$   
 14.  $f(x) = x^{-1/2}, a = 4, n = 2, 3.5 \leq x \leq 4.5$   
 15.  $f(x) = x^{2/3}, a = 1, n = 3, 0.8 \leq x \leq 1.2$   
 16.  $f(x) = \sin x, a = \pi/6, n = 4, 0 \leq x \leq \pi/3$   
 17.  $f(x) = \sec x, a = 0, n = 2, -0.2 \leq x \leq 0.2$   
 18.  $f(x) = \ln(1 + 2x), a = 1, n = 3, 0.5 \leq x \leq 1.5$   
 19.  $f(x) = e^{x^2}, a = 0, n = 3, 0 \leq x \leq 0.1$   
 20.  $f(x) = x \ln x, a = 1, n = 3, 0.5 \leq x \leq 1.5$   
 21.  $f(x) = x \sin x, a = 0, n = 4, -1 \leq x \leq 1$   
 22.  $f(x) = \sinh 2x, a = 0, n = 5, -1 \leq x \leq 1$
- 23.** Use the information from Exercise 5 to estimate  $\cos 80^\circ$  correct to five decimal places.
- 24.** Use the information from Exercise 16 to estimate  $\sin 38^\circ$  correct to five decimal places.
- 25.** Use Taylor's Inequality to determine the number of terms of the Maclaurin series for  $e^x$  that should be used to estimate  $e^{0.1}$  to within 0.00001.
- 26.** How many terms of the Maclaurin series for  $\ln(1 + x)$  do you need to use to estimate  $\ln 1.4$  to within 0.001?
- 27–29** Use the Alternating Series Estimation Theorem or Taylor's Inequality to estimate the range of values of  $x$  for which the given approximation is accurate to within the stated error. Check your answer graphically.
27.  $\sin x \approx x - \frac{x^3}{6}$  ( $|\text{error}| < 0.01$ )  
 28.  $\cos x \approx 1 - \frac{x^2}{2} + \frac{x^4}{24}$  ( $|\text{error}| < 0.005$ )  
 29.  $\arctan x \approx x - \frac{x^3}{3} + \frac{x^5}{5}$  ( $|\text{error}| < 0.05$ )
- 30.** Suppose you know that
- $$f^{(n)}(4) = \frac{(-1)^n n!}{3^n (n+1)}$$
- and the Taylor series of  $f$  centered at 4 converges to  $f(x)$  for all  $x$  in the interval of convergence. Show that the fifth-degree Taylor polynomial approximates  $f(5)$  with error less than 0.0002.
- 31.** A car is moving with speed 20 m/s and acceleration 2 m/s<sup>2</sup> at a given instant. Using a second-degree Taylor polynomial, estimate how far the car moves in the next second. Would it be reasonable to use this polynomial to estimate the distance traveled during the next minute?
- 32.** The resistivity  $\rho$  of a conducting wire is the reciprocal of the conductivity and is measured in units of ohm-meters ( $\Omega\text{-m}$ ). The resistivity of a given metal depends on the temperature according to the equation
- $$\rho(t) = \rho_{20} e^{\alpha(t-20)}$$
- where  $t$  is the temperature in  $^\circ\text{C}$ . There are tables that list the values of  $\alpha$  (called the temperature coefficient) and  $\rho_{20}$  (the resistivity at  $20^\circ\text{C}$ ) for various metals. Except at very low temperatures, the resistivity varies almost linearly with temperature and so it is common to approximate the expression for  $\rho(t)$  by its first- or second-degree Taylor polynomial at  $t = 20$ .
- (a) Find expressions for these linear and quadratic approximations.

- (b) For copper, the tables give  $\alpha = 0.0039/\text{ }^{\circ}\text{C}$  and  $\rho_{20} = 1.7 \times 10^{-8} \Omega\text{-m}$ . Graph the resistivity of copper and the linear and quadratic approximations for  $-250\text{ }^{\circ}\text{C} \leq t \leq 1000\text{ }^{\circ}\text{C}$ .
- (c) For what values of  $t$  does the linear approximation agree with the exponential expression to within one percent?
33. An electric dipole consists of two electric charges of equal magnitude and opposite sign. If the charges are  $q$  and  $-q$  and are located at a distance  $d$  from each other, then the electric field  $E$  at the point  $P$  in the figure is

$$E = \frac{q}{D^2} - \frac{q}{(D+d)^2}$$

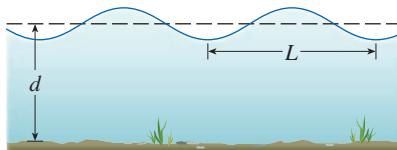

By expanding this expression for  $E$  as a series in powers of  $d/D$ , show that  $E$  is approximately proportional to  $1/D^3$  when  $P$  is far away from the dipole.

34. (a) Derive Equation 3 for Gaussian optics from Equation 1 by approximating  $\cos \phi$  in Equation 2 by its first-degree Taylor polynomial.  
 (b) Show that if  $\cos \phi$  is replaced by its third-degree Taylor polynomial in Equation 2, then Equation 1 becomes Equation 4 for third-order optics. [Hint: Use the first two terms in the binomial series for  $\ell_o^{-1}$  and  $\ell_i^{-1}$ . Also, use  $\phi \approx \sin \phi$ .]  
 35. If a water wave with length  $L$  moves with velocity  $v$  across a body of water with depth  $d$ , as shown in the figure, then

$$v^2 = \frac{gL}{2\pi} \tanh \frac{2\pi d}{L}$$

- (a) If the water is deep, show that  $v \approx \sqrt{gL/(2\pi)}$ .  
 (b) If the water is shallow, use the Maclaurin series for  $\tanh$  to show that  $v \approx \sqrt{gd}$ . (Thus in shallow water the velocity of a wave tends to be independent of the length of the wave.)  
 (c) Use the Alternating Series Estimation Theorem to show that if  $L > 10d$ , then the estimate  $v^2 \approx gd$  is accurate to within  $0.014gL$ .

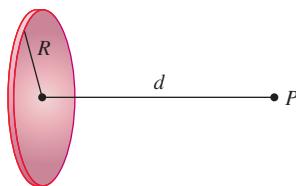

36. A uniformly charged disk has radius  $R$  and surface charge density  $\sigma$  as in the figure. The electric potential  $V$  at a point  $P$  at a distance  $d$  along the perpendicular central axis of the disk is

$$V = 2\pi k_e \sigma (\sqrt{d^2 + R^2} - d)$$

where  $k_e$  is a constant (called Coulomb's constant). Show that

$$V \approx \frac{\pi k_e R^2 \sigma}{d} \quad \text{for large } d$$

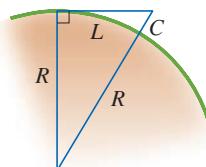

37. If a surveyor measures differences in elevation when making plans for a highway across a desert, corrections must be made for the curvature of the earth.  
 (a) If  $R$  is the radius of the earth and  $L$  is the length of the highway, show that the correction is

$$C = R \sec(L/R) - R$$

- (b) Use a Taylor polynomial to show that

$$C \approx \frac{L^2}{2R} + \frac{5L^4}{24R^3}$$

- (c) Compare the corrections given by the formulas in parts (a) and (b) for a highway that is 100 km long. (Take the radius of the earth to be 6370 km.)

38. The period of a pendulum with length  $L$  that makes a maximum angle  $\theta_0$  with the vertical is

$$T = 4 \sqrt{\frac{L}{g}} \int_0^{\pi/2} \frac{dx}{\sqrt{1 - k^2 \sin^2 x}}$$

where  $k = \sin(\frac{1}{2}\theta_0)$  and  $g$  is the acceleration due to gravity. (In Exercise 7.7.42 we approximated this integral using Simpson's Rule.)

- (a) Expand the integrand as a binomial series and use the result of Exercise 7.1.56 to show that

$$T = 2\pi \sqrt{\frac{L}{g}} \left[ 1 + \frac{1^2}{2^2} k^2 + \frac{1^2 3^2}{2^2 4^2} k^4 + \frac{1^2 3^2 5^2}{2^2 4^2 6^2} k^6 + \dots \right]$$

If  $\theta_0$  is not too large, the approximation  $T \approx 2\pi\sqrt{L/g}$ , obtained by using only the first term in the series, is often used. A better approximation is obtained by using two terms:

$$T \approx 2\pi \sqrt{\frac{L}{g}} \left( 1 + \frac{1}{4} k^2 \right)$$

- (b) Notice that all the terms in the series after the first one have coefficients that are at most  $\frac{1}{4}$ . Use this fact to compare this series with a geometric series and show that

$$2\pi \sqrt{\frac{L}{g}} \left(1 + \frac{1}{4}k^2\right) \leq T \leq 2\pi \sqrt{\frac{L}{g}} \frac{4 - 3k^2}{4 - 4k^2}$$

- (c) Use the inequalities in part (b) to estimate the period of a pendulum with  $L = 1$  meter and  $\theta_0 = 10^\circ$ . How does it compare with the estimate  $T \approx 2\pi\sqrt{L/g}$ ? What if  $\theta_0 = 42^\circ$ ?

39. In Section 4.8 we considered Newton's method for approximating a solution  $r$  of the equation  $f(x) = 0$ , and from an ini-

tial approximation  $x_1$  we obtained successive approximations  $x_2, x_3, \dots$ , where

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

Use Taylor's Inequality with  $n = 1$ ,  $a = x_n$ , and  $x = r$  to show that if  $f''(x)$  exists on an interval  $I$  containing  $r, x_n$ , and  $x_{n+1}$ , and  $|f''(x)| \leq M, |f'(x)| \geq K$  for all  $x \in I$ , then

$$|x_{n+1} - r| \leq \frac{M}{2K} |x_n - r|^2$$

[This means that if  $x_n$  is accurate to  $d$  decimal places, then  $x_{n+1}$  is accurate to about  $2d$  decimal places. More precisely, if the error at stage  $n$  is at most  $10^{-m}$ , then the error at stage  $n + 1$  is at most  $(M/2K)10^{-2m}$ .]

## APPLIED PROJECT

## RADIATION FROM THE STARS

Luke Dodd / SCIENCE PHOTO LIBRARY / Getty Images

Any object emits radiation when heated. A *blackbody* is a system that absorbs all the radiation that falls on it. For instance, a matte black surface or a large cavity with a small hole in its wall (like a blast furnace) is a blackbody and emits blackbody radiation. Even the radiation from the sun is close to being blackbody radiation.

Proposed in the late 19th century, the Rayleigh-Jeans Law expresses the energy density of blackbody radiation of wavelength  $\lambda$  as

$$f(\lambda) = \frac{8\pi kT}{\lambda^4}$$

where  $\lambda$  is measured in meters,  $T$  is the temperature in kelvins (K), and  $k$  is Boltzmann's constant. The Rayleigh-Jeans Law agrees with experimental measurements for long wavelengths but disagrees drastically for short wavelengths. [The law predicts that  $f(\lambda) \rightarrow \infty$  as  $\lambda \rightarrow 0^+$  but experiments have shown that  $f(\lambda) \rightarrow 0$ .] This fact is known as the *ultraviolet catastrophe*.

In 1900 Max Planck found a better model (known now as Planck's Law) for blackbody radiation:

$$f(\lambda) = \frac{8\pi hc\lambda^{-5}}{e^{hc/(\lambda kT)} - 1}$$

where  $\lambda$  is measured in meters,  $T$  is the temperature (in kelvins), and

$$h = \text{Planck's constant} = 6.6262 \times 10^{-34} \text{ J}\cdot\text{s}$$

$$c = \text{speed of light} = 2.997925 \times 10^8 \text{ m/s}$$

$$k = \text{Boltzmann's constant} = 1.3807 \times 10^{-23} \text{ J/K}$$

1. Use l'Hospital's Rule to show that

$$\lim_{\lambda \rightarrow 0^+} f(\lambda) = 0 \quad \text{and} \quad \lim_{\lambda \rightarrow \infty} f(\lambda) = 0$$

for Planck's Law. So this law models blackbody radiation better than the Rayleigh-Jeans Law for short wavelengths.

2. Use a Taylor polynomial to show that, for large wavelengths, Planck's Law gives approximately the same values as the Rayleigh-Jeans Law.

3. Graph  $f$  as given by both laws on the same screen and comment on the similarities and differences. Use  $T = 5700$  K (the temperature of the sun). (You may want to change from meters to the more convenient unit of micrometers:  $1 \mu\text{m} = 10^{-6}$  m.)
4. Use your graph in Problem 3 to estimate the value of  $\lambda$  for which  $f(\lambda)$  is a maximum under Planck's Law.
5. Investigate how the graph of  $f$  changes as  $T$  varies. (Use Planck's Law.) In particular, graph  $f$  for the stars Betelgeuse ( $T = 3400$  K), Procyon ( $T = 6400$  K), and Sirius ( $T = 9200$  K), as well as the sun. How does the total radiation emitted (the area under the curve) vary with  $T$ ? Use the graph to comment on why Sirius is known as a blue star and Betelgeuse as a red star.

### CONCEPT CHECK

1. (a) What is a convergent sequence?  
 (b) What is a convergent series?  
 (c) What does  $\lim_{n \rightarrow \infty} a_n = 3$  mean?  
 (d) What does  $\sum_{n=1}^{\infty} a_n = 3$  mean?
2. (a) What is a bounded sequence?  
 (b) What is a monotonic sequence?  
 (c) What can you say about a bounded monotonic sequence?
3. (a) What is a geometric series? Under what circumstances is it convergent? What is its sum?  
 (b) What is a  $p$ -series? Under what circumstances is it convergent?
4. Suppose  $\sum a_n = 3$  and  $s_n$  is the  $n$ th partial sum of the series. What is  $\lim_{n \rightarrow \infty} a_n$ ? What is  $\lim_{n \rightarrow \infty} s_n$ ?
5. State the following.  
 (a) The Test for Divergence  
 (b) The Integral Test  
 (c) The Direct Comparison Test  
 (d) The Limit Comparison Test  
 (e) The Alternating Series Test  
 (f) The Ratio Test  
 (g) The Root Test
6. (a) What is an absolutely convergent series?  
 (b) What can you say about such a series?  
 (c) What is a conditionally convergent series?
7. (a) If a series is convergent by the Integral Test, how do you estimate its sum?
- Answers to the Concept Check are available at [StewartCalculus.com](http://StewartCalculus.com).
- (b) If a series is convergent by the Direct Comparison Test, how do you estimate its sum?  
 (c) If a series is convergent by the Alternating Series Test, how do you estimate its sum?
8. (a) Write the general form of a power series.  
 (b) What is the radius of convergence of a power series?  
 (c) What is the interval of convergence of a power series?
9. Suppose  $f(x)$  is the sum of a power series with radius of convergence  $R$ .  
 (a) How do you differentiate  $f$ ? What is the radius of convergence of the series for  $f'$ ?  
 (b) How do you integrate  $f$ ? What is the radius of convergence of the series for  $\int f(x) dx$ ?
10. (a) Write an expression for the  $n$ th-degree Taylor polynomial of  $f$  centered at  $a$ .  
 (b) Write an expression for the Taylor series of  $f$  centered at  $a$ .  
 (c) Write an expression for the Maclaurin series of  $f$ .  
 (d) How do you show that  $f(x)$  is equal to the sum of its Taylor series?  
 (e) State Taylor's Inequality.
11. Write the Maclaurin series and the interval of convergence for each of the following functions.  
 (a)  $1/(1 - x)$       (b)  $e^x$       (c)  $\sin x$   
 (d)  $\cos x$       (e)  $\tan^{-1} x$       (f)  $\ln(1 + x)$
12. Write the binomial series expansion of  $(1 + x)^k$ . What is the radius of convergence of this series?

### TRUE-FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

1. If  $\lim_{n \rightarrow \infty} a_n = 0$ , then  $\sum a_n$  is convergent.
2. The series  $\sum_{n=1}^{\infty} n^{-\sin 1}$  is convergent.
3. If  $\lim_{n \rightarrow \infty} a_n = L$ , then  $\lim_{n \rightarrow \infty} a_{2n+1} = L$ .
4. If  $\sum c_n 6^n$  is convergent, then  $\sum c_n (-2)^n$  is convergent.
5. If  $\sum c_n 6^n$  is convergent, then  $\sum c_n (-6)^n$  is convergent.
6. If  $\sum c_n x^n$  diverges when  $x = 6$ , then it diverges when  $x = 10$ .
7. The Ratio Test can be used to determine whether  $\sum 1/n^3$  converges.
8. The Ratio Test can be used to determine whether  $\sum 1/n!$  converges.
9. If  $0 \leq a_n \leq b_n$  and  $\sum b_n$  diverges, then  $\sum a_n$  diverges.

$$10. \sum_{n=0}^{\infty} \frac{(-1)^n}{n!} = \frac{1}{e}$$

### EXERCISES

- 1–8** Determine whether the sequence is convergent or divergent. If it is convergent, find its limit.

$$1. a_n = \frac{2 + n^3}{1 + 2n^3}$$

$$2. a_n = \frac{9^{n+1}}{10^n}$$

$$3. a_n = \frac{n^3}{1 + n^2}$$

$$4. a_n = \cos(n\pi/2)$$

$$5. a_n = \frac{n \sin n}{n^2 + 1}$$

$$6. a_n = \frac{\ln n}{\sqrt{n}}$$

$$7. \{(1 + 3/n)^{4n}\}$$

$$8. \{(-10)^n/n!\}$$

- 9.** A sequence is defined recursively by the equations  $a_1 = 1$ ,  $a_{n+1} = \frac{1}{3}(a_n + 4)$ . Show that  $\{a_n\}$  is increasing and  $a_n < 2$  for all  $n$ . Deduce that  $\{a_n\}$  is convergent and find its limit.

- 10.** Show that  $\lim_{n \rightarrow \infty} n^4 e^{-n} = 0$  and use a graph to find the smallest value of  $N$  that corresponds to  $\varepsilon = 0.1$  in the precise definition of a limit.

- 11–22** Determine whether the series is convergent or divergent.

$$11. \sum_{n=1}^{\infty} \frac{n}{n^3 + 1}$$

$$12. \sum_{n=1}^{\infty} \frac{n^2 + 1}{n^3 + 1}$$

$$13. \sum_{n=1}^{\infty} \frac{n^3}{5^n}$$

$$14. \sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n + 1}}$$

11. If  $-1 < \alpha < 1$ , then  $\lim_{n \rightarrow \infty} \alpha^n = 0$ .
12. If  $\sum a_n$  is divergent, then  $\sum |a_n|$  is divergent.
13. If  $f(x) = 2x - x^2 + \frac{1}{3}x^3 - \dots$  converges for all  $x$ , then  $f'''(0) = 2$ .
14. If  $\{a_n\}$  and  $\{b_n\}$  are divergent, then  $\{a_n + b_n\}$  is divergent.
15. If  $\{a_n\}$  and  $\{b_n\}$  are divergent, then  $\{a_n b_n\}$  is divergent.
16. If  $\{a_n\}$  is decreasing and  $a_n > 0$  for all  $n$ , then  $\{a_n\}$  is convergent.
17. If  $a_n > 0$  and  $\sum a_n$  converges, then  $\sum (-1)^n a_n$  converges.
18. If  $a_n > 0$  and  $\lim_{n \rightarrow \infty} (a_{n+1}/a_n) < 1$ , then  $\lim_{n \rightarrow \infty} a_n = 0$ .
19.  $0.99999\dots = 1$
20. If  $\lim_{n \rightarrow \infty} a_n = 2$ , then  $\lim_{n \rightarrow \infty} (a_{n+3} - a_n) = 0$ .
21. If a finite number of terms are added to a convergent series, then the new series is still convergent.
22. If  $\sum_{n=1}^{\infty} a_n = A$  and  $\sum_{n=1}^{\infty} b_n = B$ , then  $\sum_{n=1}^{\infty} a_n b_n = AB$ .

$$15. \sum_{n=2}^{\infty} \frac{1}{n\sqrt{\ln n}}$$

$$16. \sum_{n=1}^{\infty} \ln\left(\frac{n}{3n + 1}\right)$$

$$17. \sum_{n=1}^{\infty} \frac{\cos 3n}{1 + (1.2)^n}$$

$$18. \sum_{n=1}^{\infty} \frac{n^{2n}}{(1 + 2n^2)^n}$$

$$19. \sum_{n=1}^{\infty} \frac{1 \cdot 3 \cdot 5 \cdots (2n - 1)}{5^n n!}$$

$$20. \sum_{n=1}^{\infty} \frac{(-5)^{2n}}{n^2 9^n}$$

$$21. \sum_{n=1}^{\infty} (-1)^{n-1} \frac{\sqrt{n}}{n + 1}$$

$$22. \sum_{n=1}^{\infty} \frac{\sqrt{n+1} - \sqrt{n-1}}{n}$$

- 23–26** Determine whether the series is absolutely convergent, conditionally convergent, or divergent.

$$23. \sum_{n=1}^{\infty} (-1)^{n-1} n^{-1/3}$$

$$24. \sum_{n=1}^{\infty} (-1)^{n-1} n^{-3}$$

$$25. \sum_{n=1}^{\infty} \frac{(-1)^n (n + 1) 3^n}{2^{2n+1}}$$

$$26. \sum_{n=2}^{\infty} \frac{(-1)^n \sqrt{n}}{\ln n}$$

**27–31** Find the sum of the series.

27.  $\sum_{n=1}^{\infty} \frac{(-3)^{n-1}}{2^{3n}}$

28.  $\sum_{n=1}^{\infty} \frac{1}{n(n+3)}$

29.  $\sum_{n=1}^{\infty} [\tan^{-1}(n+1) - \tan^{-1}n]$

30.  $\sum_{n=0}^{\infty} \frac{(-1)^n \pi^n}{3^{2n}(2n)!}$

31.  $1 - e + \frac{e^2}{2!} - \frac{e^3}{3!} + \frac{e^4}{4!} - \dots$

32. Express the repeating decimal  $4.17326326326\dots$  as a fraction.

33. Show that  $\cosh x \geq 1 + \frac{1}{2}x^2$  for all  $x$ .

34. For what values of  $x$  does the series  $\sum_{n=1}^{\infty} (\ln x)^n$  converge?

35. Find the sum of the series

$$\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^5}$$

correct to four decimal places.

36. (a) Find the partial sum  $s_5$  of the series  $\sum_{n=1}^{\infty} 1/n^6$  and estimate the error in using it as an approximation to the sum of the series.  
 (b) Find the sum of this series correct to five decimal places.

37. Use the sum of the first eight terms to approximate the sum of the series  $\sum_{n=1}^{\infty} (2 + 5^n)^{-1}$ . Estimate the error involved in this approximation.

38. (a) Show that the series  $\sum_{n=1}^{\infty} \frac{n^n}{(2n)!}$  is convergent.

(b) Deduce that  $\lim_{n \rightarrow \infty} \frac{n^n}{(2n)!} = 0$ .

39. Prove that if the series  $\sum_{n=1}^{\infty} a_n$  is absolutely convergent, then the series

$$\sum_{n=1}^{\infty} \left( \frac{n+1}{n} \right) a_n$$

is also absolutely convergent.

**40–43** Find the radius of convergence and interval of convergence of the series.

40.  $\sum_{n=1}^{\infty} (-1)^n \frac{x^n}{n^2 5^n}$

41.  $\sum_{n=1}^{\infty} \frac{(x+2)^n}{n 4^n}$

42.  $\sum_{n=1}^{\infty} \frac{2^n(x-2)^n}{(n+2)!}$

43.  $\sum_{n=0}^{\infty} \frac{2^n(x-3)^n}{\sqrt{n+3}}$

**44.** Find the radius of convergence of the series

$$\sum_{n=1}^{\infty} \frac{(2n)!}{(n!)^2} x^n$$

**45.** Find the Taylor series of  $f(x) = \sin x$  at  $a = \pi/6$ .

**46.** Find the Taylor series of  $f(x) = \cos x$  at  $a = \pi/3$ .

**47–54** Find the Maclaurin series for  $f$  and the associated radius of convergence. You may use either the direct method (definition of a Maclaurin series) or the Maclaurin series listed in Table 11.10.1.

47.  $f(x) = \frac{x^2}{1+x}$

48.  $f(x) = \tan^{-1}(x^2)$

49.  $f(x) = \ln(4-x)$

50.  $f(x) = xe^{2x}$

51.  $f(x) = \sin(x^4)$

52.  $f(x) = 10^x$

53.  $f(x) = 1/\sqrt[4]{16-x}$

54.  $f(x) = (1-3x)^{-5}$

55. Evaluate  $\int \frac{e^x}{x} dx$  as an infinite series.

56. Use series to approximate  $\int_0^1 \sqrt{1+x^4} dx$  correct to two decimal places.

**57–58**

(a) Approximate  $f$  by a Taylor polynomial with degree  $n$  at the number  $a$ .

(b) Graph  $f$  and  $T_n$  on a common screen.

(c) Use Taylor's Inequality to estimate the accuracy of the approximation  $f(x) \approx T_n(x)$  when  $x$  lies in the given interval.

(d) Check your result in part (c) by graphing  $|R_n(x)|$ .

57.  $f(x) = \sqrt{x}, \quad a = 1, \quad n = 3, \quad 0.9 \leq x \leq 1.1$

58.  $f(x) = \sec x, \quad a = 0, \quad n = 2, \quad 0 \leq x \leq \pi/6$

**59.** Use series to evaluate the following limit.

$$\lim_{x \rightarrow 0} \frac{\sin x - x}{x^3}$$

**60.** The force due to gravity on an object with mass  $m$  at a height  $h$  above the surface of the earth is

$$F = \frac{mgR^2}{(R+h)^2}$$

where  $R$  is the radius of the earth and  $g$  is the acceleration due to gravity for an object on the surface of the earth.

- (a) Express  $F$  as a series in powers of  $h/R$ .  
 (b) Observe that if we approximate  $F$  by the first term in the series, we get the expression  $F \approx mg$  that is usually used when  $h$  is much smaller than  $R$ . Use the Alternating Series Estimation Theorem to estimate the range of values of  $h$  for which the approximation  $F \approx mg$  is accurate to within one percent. (Use  $R = 6400$  km.)

- 61.** Suppose that  $f(x) = \sum_{n=0}^{\infty} c_n x^n$  for all  $x$ .

(a) If  $f$  is an odd function, show that

$$c_0 = c_2 = c_4 = \dots = 0$$

(b) If  $f$  is an even function, show that

$$c_1 = c_3 = c_5 = \dots = 0$$

- 62.** If  $f(x) = e^{x^2}$ , show that  $f^{(2n)}(0) = \frac{(2n)!}{n!}$ .

# Problems Plus

Before you look at the solution of the example, cover it up and first try to solve the problem yourself.

**EXAMPLE** Find the sum of the series  $\sum_{n=0}^{\infty} \frac{(x+2)^n}{(n+3)!}$ .

**SOLUTION** The problem-solving principle that is relevant here is *recognizing something familiar*. Does the given series look anything like a series that we already know? Well, it does have some ingredients in common with the Maclaurin series for the exponential function:

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$$

We can make this series look more like our given series by replacing  $x$  by  $x+2$ :

$$e^{x+2} = \sum_{n=0}^{\infty} \frac{(x+2)^n}{n!} = 1 + (x+2) + \frac{(x+2)^2}{2!} + \frac{(x+2)^3}{3!} + \dots$$

But here the exponent in the numerator matches the number in the denominator whose factorial is taken. To make that happen in the given series, let's multiply and divide by  $(x+2)^3$ :

$$\begin{aligned} \sum_{n=0}^{\infty} \frac{(x+2)^n}{(n+3)!} &= \frac{1}{(x+2)^3} \sum_{n=0}^{\infty} \frac{(x+2)^{n+3}}{(n+3)!} \\ &= (x+2)^{-3} \left[ \frac{(x+2)^3}{3!} + \frac{(x+2)^4}{4!} + \dots \right] \end{aligned}$$

We see that the series between brackets is just the series for  $e^{x+2}$  with the first three terms missing. So

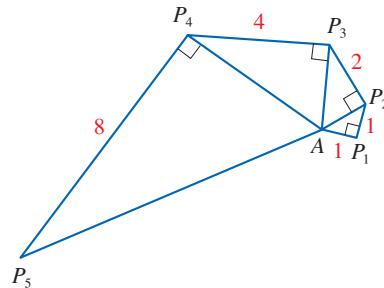

$$\sum_{n=0}^{\infty} \frac{(x+2)^n}{(n+3)!} = (x+2)^{-3} \left[ e^{x+2} - 1 - (x+2) - \frac{(x+2)^2}{2!} \right]$$

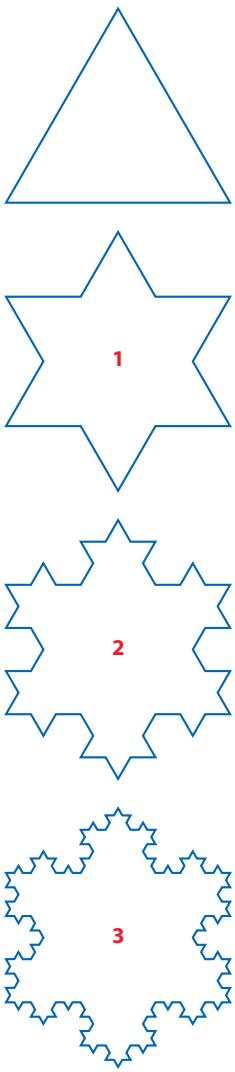

## Problems

1. (a) Show that  $\tan \frac{1}{2}x = \cot \frac{1}{2}x - 2 \cot x$ .  
(b) Find the sum of the series

$$\sum_{n=1}^{\infty} \frac{1}{2^n} \tan \frac{x}{2^n}$$

2. Let  $\{P_n\}$  be a sequence of points determined as in the figure. Thus  $|AP_1| = 1$ ,  $|P_n P_{n+1}| = 2^{n-1}$ , and angle  $AP_n P_{n+1}$  is a right angle. Find  $\lim_{n \rightarrow \infty} \angle P_n AP_{n+1}$ .

**FIGURE FOR PROBLEM 3**

- 3.** To construct the **snowflake curve**, start with an equilateral triangle with sides of length 1. Step 1 in the construction is to divide each side into three equal parts, construct an equilateral triangle on the middle part, and then delete the middle part (see the figure). Step 2 is to repeat step 1 for each side of the resulting polygon. This process is repeated at each succeeding step. The snowflake curve is the curve that results from repeating this process indefinitely.

- Let  $s_n$ ,  $l_n$ , and  $p_n$  represent the number of sides, the length of a side, and the total length of the  $n$ th approximating curve (the curve obtained after step  $n$  of the construction), respectively. Find formulas for  $s_n$ ,  $l_n$ , and  $p_n$ .
- Show that  $p_n \rightarrow \infty$  as  $n \rightarrow \infty$ .
- Sum an infinite series to find the area enclosed by the snowflake curve.

*Note:* Parts (b) and (c) show that the snowflake curve is infinitely long but encloses only a finite area.

- 4.** Find the sum of the series

$$1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{6} + \frac{1}{8} + \frac{1}{9} + \frac{1}{12} + \dots$$

where the terms are the reciprocals of the positive integers whose only prime factors are 2s and 3s.

- 5.** (a) Show that for  $xy \neq -1$ ,

$$\arctan x - \arctan y = \arctan \frac{x - y}{1 + xy}$$

if the left side lies between  $-\pi/2$  and  $\pi/2$ .

- (b) Show that  $\arctan \frac{120}{119} - \arctan \frac{1}{239} = \pi/4$ .

- (c) Deduce the following formula of John Machin (1680–1751):

$$4 \arctan \frac{1}{5} - \arctan \frac{1}{239} = \frac{\pi}{4}$$

- (d) Use the Maclaurin series for arctan to show that

$$0.1973955597 < \arctan \frac{1}{5} < 0.1973955616$$

- (e) Show that

$$0.004184075 < \arctan \frac{1}{239} < 0.004184077$$

- (f) Deduce that, correct to seven decimal places,  $\pi \approx 3.1415927$ .

Machin used this method in 1706 to find  $\pi$  correct to 100 decimal places. Recently, with the aid of computers, the value of  $\pi$  has been computed to increasingly greater accuracy, well into the trillions of decimal places.

- 6.** (a) Prove a formula similar to the one in Problem 5(a) but involving  $\operatorname{arccot}$  instead of  $\arctan$ .

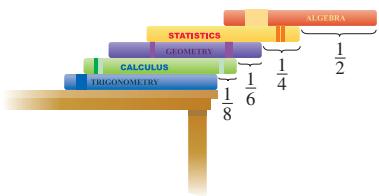

- (b) Find the sum of the series  $\sum_{n=0}^{\infty} \operatorname{arccot}(n^2 + n + 1)$ .

- 7.** Use the result of Problem 5(a) to find the sum of the series  $\sum_{n=1}^{\infty} \arctan(2/n^2)$ .

- 8.** If  $a_0 + a_1 + a_2 + \dots + a_k = 0$ , show that

$$\lim_{n \rightarrow \infty} (a_0\sqrt{n} + a_1\sqrt{n+1} + a_2\sqrt{n+2} + \dots + a_k\sqrt{n+k}) = 0$$

If you don't see how to prove this, try the problem-solving strategy of *using analogy*. Try the special cases  $k = 1$  and  $k = 2$  first. If you can see how to prove the assertion for these cases, then you will probably see how to prove it in general.

**FIGURE FOR PROBLEM 10**

9. Find the interval of convergence of  $\sum_{n=1}^{\infty} n^3 x^n$  and find its sum.

10. Suppose you have a large supply of books, all the same size, and you stack them at the edge of a table, with each book extending farther beyond the edge of the table than the one beneath it. Show that it is possible to do this so that the top book extends entirely beyond the table. In fact, show that the top book can extend any distance at all beyond the edge of the table if the stack is high enough. Use the following method of stacking: The top book extends half its length beyond the second book. The second book extends a quarter of its length beyond the third. The third extends one-sixth of its length beyond the fourth, and so on. (Try it yourself with a deck of cards.) Consider centers of mass.

11. Find the sum of the series  $\sum_{n=2}^{\infty} \ln\left(1 - \frac{1}{n^2}\right)$ .

12. If  $p > 1$ , evaluate the expression

$$\frac{1 + \frac{1}{2^p} + \frac{1}{3^p} + \frac{1}{4^p} + \dots}{1 - \frac{1}{2^p} + \frac{1}{3^p} - \frac{1}{4^p} + \dots}$$

13. Suppose that circles of equal diameter are packed tightly in  $n$  rows inside an equilateral triangle. (The figure illustrates the case  $n = 4$ .) If  $A$  is the area of the triangle and  $A_n$  is the total area occupied by the  $n$  rows of circles, show that

$$\lim_{n \rightarrow \infty} \frac{A_n}{A} = \frac{\pi}{2\sqrt{3}}$$

14. A sequence  $\{a_n\}$  is defined recursively by the equations

$$a_0 = a_1 = 1 \quad n(n-1)a_n = (n-1)(n-2)a_{n-1} - (n-3)a_{n-2}$$

Find the sum of the series  $\sum_{n=0}^{\infty} a_n$ .

15. If the curve  $y = e^{-x/10} \sin x$ ,  $x \geq 0$ , is rotated about the  $x$ -axis, the resulting solid looks like an infinite decreasing string of beads.

- (a) Find the exact volume of the  $n$ th bead. (Use either a table of integrals or a computer algebra system.)  
 (b) Find the total volume of the beads.

16. Starting with the vertices  $P_1(0, 1)$ ,  $P_2(1, 1)$ ,  $P_3(1, 0)$ ,  $P_4(0, 0)$  of a square, we construct further points as shown in the figure:  $P_5$  is the midpoint of  $P_1P_2$ ,  $P_6$  is the midpoint of  $P_2P_3$ ,  $P_7$  is the midpoint of  $P_3P_4$ , and so on. The polygonal spiral path  $P_1P_2P_3P_4P_5P_6P_7\dots$  approaches a point  $P$  inside the square.

- (a) If the coordinates of  $P_n$  are  $(x_n, y_n)$ , show that  $\frac{1}{2}x_n + x_{n+1} + x_{n+2} + x_{n+3} = 2$  and find a similar equation for the  $y$ -coordinates.  
 (b) Find the coordinates of  $P$ .

17. Find the sum of the series  $\sum_{n=1}^{\infty} \frac{(-1)^n}{(2n+1)3^n}$ .

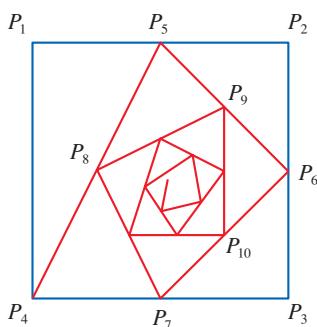

18. Carry out the following steps to show that

$$\frac{1}{1 \cdot 2} + \frac{1}{3 \cdot 4} + \frac{1}{5 \cdot 6} + \frac{1}{7 \cdot 8} + \dots = \ln 2$$

- (a) Use the formula for the sum of a finite geometric series (11.2.3) to get an expression for

$$1 - x + x^2 - x^3 + \dots + x^{2n-2} - x^{2n-1}$$

**FIGURE FOR PROBLEM 13**

**FIGURE FOR PROBLEM 16**

(b) Integrate the result of part (a) from 0 to 1 to get an expression for

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots + \frac{1}{2n-1} - \frac{1}{2n}$$

as an integral.

(c) Deduce from part (b) that

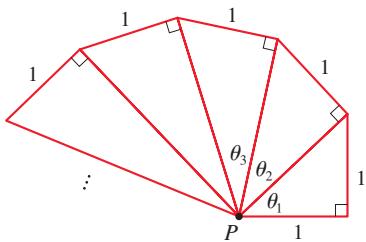

$$\left| \frac{1}{1 \cdot 2} + \frac{1}{3 \cdot 4} + \frac{1}{5 \cdot 6} + \cdots + \frac{1}{(2n-1)(2n)} - \int_0^1 \frac{dx}{1+x} \right| < \int_0^1 x^{2n} dx$$

(d) Use part (c) to show that the sum of the given series is  $\ln 2$ .

**19.** Find all the solutions of the equation

$$1 + \frac{x}{2!} + \frac{x^2}{4!} + \frac{x^3}{6!} + \frac{x^4}{8!} + \cdots = 0$$

[Hint: Consider the cases  $x \geq 0$  and  $x < 0$  separately.]

**FIGURE FOR PROBLEM 20**

**20.** Right-angled triangles are constructed as in the figure. Each triangle has height 1 and its base is the hypotenuse of the preceding triangle. Show that this sequence of triangles makes infinitely many turns around  $P$  by showing that  $\sum \theta_n$  is a divergent series.

**21.** Consider the series whose terms are the reciprocals of the positive integers that can be written in base 10 notation without using the digit 0. Show that this series is convergent and the sum is less than 90.

**22.** (a) Show that the Maclaurin series of the function

$$f(x) = \frac{x}{1-x-x^2} \quad \text{is} \quad \sum_{n=1}^{\infty} f_n x^n$$

where  $f_n$  is the  $n$ th Fibonacci number, that is,  $f_1 = 1$ ,  $f_2 = 1$ , and  $f_n = f_{n-1} + f_{n-2}$  for  $n \geq 3$ . Find the radius of convergence of the series. [Hint: Write  $x/(1-x-x^2) = c_0 + c_1x + c_2x^2 + \cdots$  and multiply both sides of this equation by  $1-x-x^2$ .]

(b) By writing  $f(x)$  as a sum of partial fractions and thereby obtaining the Maclaurin series in a different way, find an explicit formula for the  $n$ th Fibonacci number.

**23.** Let

$$u = 1 + \frac{x^3}{3!} + \frac{x^6}{6!} + \frac{x^9}{9!} + \cdots$$

$$v = x + \frac{x^4}{4!} + \frac{x^7}{7!} + \frac{x^{10}}{10!} + \cdots$$

$$w = \frac{x^2}{2!} + \frac{x^5}{5!} + \frac{x^8}{8!} + \cdots$$

Show that  $u^3 + v^3 + w^3 - 3uvw = 1$ .

**24.** Prove that if  $n > 1$ , the  $n$ th partial sum of the harmonic series is not an integer.

*Hint:* Let  $2^k$  be the largest power of 2 that is less than or equal to  $n$  and let  $M$  be the product of all odd integers that are less than or equal to  $n$ . Suppose that  $s_n = m$ , an integer. Then  $M2^k s_n = M2^k m$ . The right side of this equation is even. Prove that the left side is odd by showing that each of its terms is an even integer, except for one.
